

RF Exposure / MPE Calculation

No. : 11288814H
Applicant : Sony Interactive Entertainment Inc.
Type of Equipment : Wireless communication module
Model No. : J20H091
 *WLAN (5GHz) part
FCC ID : AK8M16DFL1

Sony Interactive Entertainment Inc. declares that Model: J20H091 complies with FCC radiation exposure requirement specified in the FCC Rule 2.1091 (for mobile).

RF Exposure Calculations:

The following information provides the minimum separation distance for the highest gain antenna provided with the “J20H091“ as calculated from (B) Limits for General Population / Uncontrolled Exposure of TABLE 1- LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE) of §1.1310 Radiofrequency radiation exposure limits.

[WLAN (5 GHz) part]

This calculation is based on the highest EIRP possible from the system, considering maximum power and antenna gain, and considering a 1mW/cm² uncontrolled exposure limit. The Friis formula used was:

$$S = \frac{P \times G}{4 \times \pi \times r^2}$$

Where

P = 15.42 mW (Maximum average output power)
 Frame power was used for the above value in consideration of 6-minutes time-averaging
 Burst power was used for the above value in consideration of worst condition.
 G = 6.792 Numerical Antenna gain; equal to 8.32dBi
 r = 20 cm (Separation distance)

Power Density Result $S = 0.02084 \text{ mW/cm}^2$

Reference:**[Bluetooth part]**

This calculation is based on the highest EIRP possible from the system, considering maximum power and antenna gain, and considering a 1mW/cm² uncontrolled exposure limit. The Friis formula used was:

$$S = \frac{P \times G}{4 \times \pi \times r^2}$$

Where

$P =$ 1.33 mW (Maximum average output power)

Frame power was used for the above value in consideration of 6-minutes time-averaging

Burst power was used for the above value in consideration of worst condition.

$G =$ 5.248 Numerical Antenna gain; equal to 7.2 dBi

$r =$ 20 cm (Separation distance)

$$\text{Power Density Result } S = 0.00139 \text{ mW/cm}^2$$

Reference:**[Bluetooth Low Energy part]**

The following information provides the minimum separation distance for the highest gain antenna provided with the “J20H091“ as calculated from (B) Limits for General Population / Uncontrolled Exposure of TABLE 1- LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE) of §1.1310 Radiofrequency radiation exposure limits.

This calculation is based on the highest EIRP possible from the system, considering maximum power and antenna gain, and considering a 1mW/cm² uncontrolled exposure limit. The Friis formula used was:

$$S = \frac{P \times G}{4 \times \pi \times r^2}$$

Where

$P =$ 0.99 mW (Maximum average output power)

Frame power was used for the above value in consideration of 6-minutes time-averaging

Burst power was used for the above value in consideration of worst condition.

$G =$ 5.248 Numerical Antenna gain; equal to 7.2dBi

$r =$ 20 cm (Separation distance)

$$\text{Power Density Result } S = 0.00103 \text{ mW/cm}^2$$

Therefore, if WLAN 5GHz and Bluetooth transmit simultaneously,

$$S=0.02084 \text{ mW/cm}^2 + 0.00139 \text{ mW/cm}^2 \\ =0.02223 \text{ mW/cm}^2$$

Therefore, if Bluetooth Low Energy and WLAN 5GHz transmit simultaneously,

$$S=0.00103 \text{ mW/cm}^2 + 0.02084 \text{ mW/cm}^2 \\ =0.02187 \text{ mW/cm}^2$$

Even taking into account the tolerance, this device can be satisfied with the limits.
