Response to RT from 7/17/2009

The RF test report lists the frequency band as 150.05 MHz to 173.95 MHz, but the SAR report measurements were performed at low channel of 150.8 MHz and high channel of 173.4 MHz. Please explain this and update exhibits as necessary.

The frequency range of the radio is 150 – 174 MHz.
The frequencies for the RF test report were selected for the low mid and high channels.
The SAR report states the frequency range of 150 – 174 MHz.
The 2 frequencies selected for test at the SAR lab were within 1 MHz of the band edges.
The power levels for the 2 reports are the same.
