3.0 SCOPE OF EVALUATION

This Certification Report was prepared on behalf of:

#### **Uniden America Corporation**

"(the 'Applicant"), in accordance with the applicable Federal Communications Commission (FCC) CFR 47 and Innovation, Scientific and Economic Development (ISED) Canada rules parts and regulations (the 'Rules'). The scope of this investigation was limited to only the equipment, devices and accessories (the 'Equipment') supplied by the Applicant. The tests and measurements performed on this Equipment were only those set forth in the applicable Rules and/or the Test and Measurement Standards they reference. The Rules applied and the Test and Measurement Standards used during this evaluation appear in the Normative References section of this report. The limits set forth in the technical requirements of the applicable Rules were applied to the measurement results obtained during this evaluation and ,unless otherwise noted, these limits were used as the Pass/Fail criteria. The Pass/Fail statements made in this report apply to only the tests and measurements performed on only the Equipment tested during this evaluation. Where applicable and permissible, information including test and measurement data and/or results from previous evaluations of same or similar equipment, devices and/or accessories may be cited in this report.

#### **Device Description:**

The UT664 is a 5W, FM, portable handheld Maritime Services Push-To-Talk (PTT) transceiver operating in the 156.05MHz-157.425MHz VHF band. It contains the FM transceiver and no other transmitters.

#### **Regulatory Requirement:**

As per FCC 47 CFR Part §2.1093 and Health Canada Safety Code 6, an RF Exposure evaluation report is required for this *Equipment* and the results of the RF Exposure evaluation appear in this report.

#### Filing:

This is an application for new certification.

#### Scope:

The scope of this evaluation is to evaluate the SAR for intended use applications. It will include evaluation of the VHF band transmitter for all required RF exposure configurations and accessories types. The Test Plan developed for this evaluation is based on the required test channels and configurations woroducing the highest worst case SAR. Where applicable, SAR test reduction and/or SAR test exclusion may be utilized. Test procedures are based on the requirements IEEE 1528-62209, IEC 62209-2, FCC KDB 865646, 447498, 643646 and RSS 102.

## **5.0 STATEMENT OF COMPLIANCE**

This measurement report demonstrates that samples of the product model(s) were evaluated for Specific Absorption Rate (SAR) on the date(s) shown, in accordance with the Measurement Procedures cited and were found to comply with the Standard(s) Applied based on the Exposure Limits of the Use Group indicated for which the product is intended to be used.

### **6.0 SAR MEASUREMENT SYSTEM**

## **SAR Measurement System**

Celltech Labs Inc. SAR measurement facility employs a Dosimetric Assessment System (DASY™) manufactured by Schmid & Partner Engineering AG (SPEAG™) of Zurich, Switzerland. The DASY6 measurement system is comprised of the measurement server, a robot controller, a computer, a near-field probe, a probe alignment sensor, an Elliptical Planar Phantom (ELI) phantom and a specific anthropomorphic mannequin (SAM) phantom for Head and/or Body SAR evaluations. The robot is a six-axis industrial robot performing precise movements to position the probe to the location (points) of maximum electromagnetic field (EMF). A cell controller system contains the power supply, robot controller and a teach pendant (Joystick) to control the robot's servo motors. The Staubli robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE) circuit performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. is connected to the Electro-optical coupler (EOC). The EOC performs the conversion from the optical form the DAE to digital electronic signal and transfers data to the DASY6 measurement server. The DAE4 utilizes a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gainswitching multiplexer, a fast 16-bit AD-converter, a command decoder and a control logic unit. Transmission to the DASY6 measurement server is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe-mounting device includes two different sensor systems for frontal and sidewise probe contacts. The sensor systems are also used for mechanical surface detection and probe collision detection. The robot utilizes a controller with built in VME-bus computer.

|         |         |           |            |                               |                             |                              | Result:                    |        |  |  |  |  |  |  |  |  |  |  |

Conducted Margin = P<sub>Limit</sub> - P<sub>Meas</sub>

<sup>\*</sup>The rated power and tolerance are stated for typical transmission modes and data rates. Some modes and data rates may produce lower than rated conducted power levels. Continuous Wave (CW) mode is a test mode not typical with normal transmission modes and may produce higher than rated conducted power levels Power measurements taken across the various channels, modes and data rates did not produce levels in excess of the Rated Power plus Tolerance. SAR was evaluated using .CW mode at the Maximum output power level setting and produced the most conservative SAR. The reported SAR was not scaled down.

## 8.0 NUMBER OF TEST CHANNELS (Nc)

**Table 8.1 Number of Test Channels** 

| Number of Required Test Channels |                   |                |                   |                   |            |           |  |  |
|----------------------------------|-------------------|----------------|-------------------|-------------------|------------|-----------|--|--|
|                                  | Frequency         |                | Number of         | Channels          | Spa        | cing      |  |  |
| f <sub>LOW</sub>                 | f <sub>HIGH</sub> | f <sub>C</sub> | KDB 447498        | IEC 62209         | KDB 447498 | IEC 62209 |  |  |
| (MHz)                            | (MHz)             | (MHz)          | (N <sub>C</sub> ) | (N <sub>C</sub> ) | (MHz)      | (MHz)     |  |  |
| 156.05                           | 157.425           | 156.7375       | 2                 | 3                 | 1.4        | 0.7       |  |  |

KDB 447498:  $N_C$  = RoundUp { [ 100 (  $F_{HIGH} - F_{LOW}$ )/Fc ]<sup>0.5</sup> X (  $F_C$ /100 )<sup>0.2</sup> }

IEC 62209-1:  $N_c = 2 X \{ RoundUp [ 10 ( F_{HIGH} - F_{LOW} ) / F_c ] \} + 1$ 

### Notes:

Per FCC KDB 643646 D01v01r03 (A1)(A2)

- I) When the Head/Body SAR of an antenna tested in A) is:
- a) ≤ 3.5 W/kg, testing of all other required channels is not necessary for that antenna
- b) > 3.5 W/kg and ≤ 4.0 W/kg, testing of the required immediately adjacent channel(s) is not necessary;3 testing of the other required channels may still be required
- c) > 4.0 W/kg and ≤ 6.0 W/kg, Head/Body SAR should be measured for that antenna on the required immediately adjacent channels; testing of the other required channels still needs consideration
- d) > 6.0 W/kg, test all required channels for that antenna

The number of channels tested was based on Low, Mid and High VHF Channels.

#### NOTES to Table11.1

(1) Scaling of the Maximum Measured SAR is based on the highest, 100% duty cycle for Face, Body and/or Head icluding ALL test channels, configurations and accessories used during THIS evaluation. The Measured Fluid Deviation parameters apply only to deviation of the tissue equivalent fluids used at the frequencies which produced the highest measured SAR. The Measured Conducted Power applies to the Conducted Power measured at the frequencies producing the highest Face and Body SAR. The Measured Drift is the SAR drift associated with that specific SAR measurement. The Reported SAR is the accumulation of all SAR Adjustments from the applicable Steps 1 through 4.

The Plot ID is for indentification of the SAR Measurement Plots in Annex A of this report.

NOTE: Some of the scaling factors in Steps 1 through 4 may not apply and are identified by light gray text.

#### Step 1

Per IEC-62209-1 and FCC KDB 865664. Scaling required only when Measured Fluid Deviation is greater than 5%. If the Measured Fluid Deviation is greater than 5%, Table 10.1 will be shown and will indicate the SAR scaling factor in percent (%). SAR is MULTIPLIED by this scaling factor only when the scaling factor is positive (+).

#### Step 2

Per KDB 447498. Scaling required only when the difference (Delta) between the Measured Conducted Power and the Manufacturer's Rated Conducted Power is (-) Negative. The absolute value of Delta is ADDED to the SAR.

#### Step 3

Per IEC 62209-1. Scaling required only when Measured Drift is (-) Negative. The absolute value of Measured Drift is added to Reported or Simultaneous Reported SAR.

#### Step 4

Per KDB 447498 4.3.2. The SAR, either measured or calculated, of ANY and ALL simultaneous transmitters must be added together and includes all contributors.

#### Step 5

The Reported SAR is the Maximum Final Adjusted Cumulative SAR from the applicable Steps 1 through 4 and are reported on Page 1 of this report.

### 13.2 DUT Setup and Configuration

### **DUT Setup and Configuration**

## Overview

The UT664 was evaluated for *Body* and *Face* SAR at the maximum conducted output power level, preset by the manufacturer, with a fully charged battery in unmodulated continuous transmit operation (FM mode at 100% duty cycle) with the transmit key continuously depressed. For a Push-To-Talk (PTT) device with a manually operated transmit pushbutton, a 50% duty cycle compensation for the *reported SAR* was used, as per FCC KDB 447498 (6.1).

The test procedures outlined in FCC KDB 447498 " General SAR Test Reduction Considerations for " as well as FCC KDB 865664, ISEDC RSS-102 and IEEE 1528 were used throughout the evaluation of this device in the LMR bands.

### 13.3 DUT Positioning

#### **DUT Positioning**

#### **Positioning**

The DUT Positioner was securely fastened to the Phantom Platform. Registration marks were placed on the DUT and the Positioner to ensure consistent positioning of the DUT for each test evaluation.

#### **FACE Configuration**

The DUT was securely clamped into the device holder with the surface of the DUT normally held to the user's face facing the phantom. The device holder was adjusted to ensure that the horizontal axis of the DUT was parallel to the bottom of the phantom. A 25mm spacer block was used to set the separation distance between the DUT and the phantom to 25mm. When applicable and unless by design, the antenna of the DUT was prevented from sagging away from the phantom. The spacer block was removed before testing.

## BODY Configuration

Body-Worn and Audio Accessories were affixed to the DUT in the manner in which they are intended to be used. The DUT, with its accessories, were securely clamped into the device holder with the surface of the DUT normally in contact with the body in direct contact with the bottom of the phantom, or 0mm separation from the DUT's accessory to the phantom. Body-Worn Accessory straps, linkages, etc. were positioned in a fashion resembling that for which they were intended to be used. Audio Accessory cables, etc., were positioned in a fashion resembling that for which they were intended to be used.

#### **HEAD Configuration**

This device is not intended to be held to the ear and was not tested in the HEAD configuration.

45461697 R1.0 10 December 2021

#### 13.4 General Procedures and Report

#### **General Procedures and Reporting**

#### **General Procedures**

The fluid dielectric parameters of the Active Tissue Simulating Liquid (TSL) were measured as described in this Section, recorded and entered into the DASY Measurement Server. Active meaning the TSL used during the SAR evaluation of the DUT. The temperature of the Active TSL was measured and recorded prior to performing a System Performance Check (SPC). An SPC was performed with the Active TSL prior to the start of the test series. The temperature of the Active TSL was measured throughout the day and the Active TSL temperature was maintained to  $\pm 0.5^{\circ}$ C. The Active TSL temperature was maintained to within  $\pm 2.0^{\circ}$ C throughout the test series. The liquid parameters shall be measured within 24 hours before the start of a test series and if it takes longer than 48 hours, the liquid parameters shall also be measured at the end of the test series.

An Area Scan exceeding the length and width of the DUT projection was performed and the locations of all maximas within 2dB of the Peak SAR recorded. A Zoom Scan centered over the Peak SAR location(s) was performed and the 1g and 10g SAR values recorded. The resolutions of the Area Scan and Zoom Scan are described in the Scan Resolution table(s) in this Section. A Power Reference Measurement was taken at the phantom reference point immediately prior to the Area Scan. A Power Drift measurement was taken at the phantom reference point immediately following the Zoom Scan to determine the power drift. A Z-Scan from the <u>Maximum Distance to Phantom Surface</u> to the fluid surface was performed following the power drift measurement.

#### Reporting

The 1g SAR, 10g SAR and power drift measurements are recorded in the SAR Measurement Summary tables in the SAR Measurement Summary Section of this report. The SAR values shown in the 100% DC (Duty Cycle) column are the SAR values reported by the SAR Measurement Server with the DUT operating at 100% transmit duty cycle. These tables also include other information such as transmit channel and frequency, modulation, accessories tested and DUT-phantom separation distance.

In the Scaling of Maximum Measured SAR Section of this report, the highest measured SAR in the BODY configuration, within the entire scope of this assessment, are, when applicable, scaled for Fluid Sensitivity, Manufacturer's Tune-Up Tolerance, Simultaneous Transmission and Drift. With the exception of Duty Cycle correction/compensation, SAR values are <u>ONLY</u> scaled up, not down. The final results of this scaling is the reported SAR which appears on the Cover Page of this report.

10 December 2021

### 13.5 Fluid Dielectric and Systems Performance Check

#### Fluid Dielectric and Systems Performance Check

#### Fluid Dielectric Measurement Procedure

The fluid dielectric parameters of the Tissue Simulating Liquid (TSL) are measured using the Open-Ended Coax Method connected to an Agilent 8753ET Network Analyzer connected to a measurement server running Aprel Dielectric Property Measurement System. A frequency range of ± 100MHz for frequencies > 300MHz and ± 50MHz for frequencies ≤ 300MHz with frequency step size of 10MHz is used. The center frequency is centered around the SAR measurement probe's calibration point for that TSL frequency range. A calibration of the setup is performed using a short-open-deionized water (at 23°C in a 300ml beaker) method. A sample of the TSL is placed in a 300ml beaker and the open-ended coax is submerged approximately 8mm below the fluid surface in the approximate center of the beaker. A check of the setup is made to ensure no air is trapped under the open-ended coax. The sample of TSL is measured and compared to the FCC KDB 865664 targets for HEAD or BODY for the entire fluid measurement range. Fluid adjustment are made if the dielectric parameters are > 5% in range that the DUT is to be tested. If the adjustments fail to bring the parameters to ≤ 5% but are < 10%, the SAR Fluid Sensitivity as per IEC 62201-1 and FCC KDB 865664 are applied to the highest measured SAR. A TSL with dielectric parameters > 10% in the DUT test frequency range are not used.

#### Systems Performance Check

The fluid dielectric parameters of the Active TSL are entered into the DASY Measurement Server at each of the 10MHz step size intervals. Active meaning the TSL used during the SAR evaluation of the DUT. The DASY Measurement System will automatically interpolate the dielectric parameters for DUT test frequencies that fall between the 10MHz step intervals.

A Systems Performance Check (SPC) is performed in accordance with IEEE 1528 "System Check" and FCC KDB 865664 "System Verification". A validation source, dipole or Confined Loop Antenna (CLA), is placed under the geometric center of the phantom and separated from the phantom in accordance to the validation source's Calibration Certificate data. A CW signal set to the frequency of the validate source's and SAR measurement probe's calibration frequency with a forward power set to the validation source's Calibration Certificate data power setting is applied to the validation source. An Area Scan is centered over the projection of the validation source's feed point and an Area Scan is taken. A Zoom Scan centered over the Peak SAR measurement of the Area Scan and the 1g and 10g SAR is measured. The measured 1g and 10g SAR is compared to the 1g and 10g SAR measurements from the validation source's Calibration Certificate. When required, the measured SAR is normalized to 1.0W and compared to the normalized SAR indicated on the validation source's Calibration Certificate. The SPC is considered valid when the measured and normalized SAR is 10% of the measured and normalize SAR of the validation source's Calibration Certificate.

The fluid dielectric parameters of the Active TSL and SPC are repeated when the Active TSL has been in use for greater than 84 hours or if the Active TSL temperature has exceed ± 1°C of the initial fluid analysis.

### 13.6 Scan Resolution 100MHz to 2GHz

| Scan Resolution 100MHz to 2GHz   |               |  |  |  |  |  |
|--|---------------|--|--|--|--|--|
| Maximum distance from the closest measurement point to phantom surface: (Geometric Center of Probe Center) | 4 ± 1 mm      |  |  |  |  |  |
| Maximum probe angle normal to phantom surface. (Flat Section ELI Phantom)                                  | 5° ± 1°       |  |  |  |  |  |
| Area Scan Spatial Resolution ΔX, ΔΥ  | 15 mm         |  |  |  |  |  |
| Zoom Scan Spatial Resolution ΔX, ΔΥ  | 7.5 mm        |  |  |  |  |  |
| Zoom Scan Spatial Resolution ∆Z<br>(Uniform Grid)  | 5 mm          |  |  |  |  |  |
| Zoom Scan Volume X, Y, Z   | 30 mm         |  |  |  |  |  |
| Phantom  | ELI           |  |  |  |  |  |
| Fluid Depth  | 150 ± 5 mm    |  |  |  |  |  |
| An Area Scan with an area extending beyond the device was used to locate the candi                         | idate maximas |  |  |  |  |  |

An Area Scan with an area extending beyond the device was used to locate the candidate maximas within 2dB of the global maxima.

A Zoom Scan centered over the peak SAR location(s) determined by the Area Scan was used to determine the 1-gram and 10-gram peak spatial-average SAR

t Report Issue Date: 10 December 2021

### 13.7 Scan Resolution 2GHz to 3GHz

| Scan Resolution 2GHz to 3GHz   |            |  |  |  |  |
|--|------------|--|--|--|--|
| Maximum distance from the closest measurement point to phantom surface: (Geometric Center of Probe Center) | 4 ± 1 mm   |  |  |  |  |
| Maximum probe angle normal to phantom surface. (Flat Section ELI Phantom)                                  | 5° ± 1°    |  |  |  |  |
| Area Scan Spatial Resolution $\Delta X$ , $\Delta Y$   | 12 mm      |  |  |  |  |
| Zoom Scan Spatial Resolution ΔX, ΔΥ  | 5 mm       |  |  |  |  |
| Zoom Scan Spatial Resolution ∆Z<br>(Uniform Grid)  | 5 mm       |  |  |  |  |
| Zoom Scan Volume X, Y, Z   | 30 mm      |  |  |  |  |
| Phantom  | ELI        |  |  |  |  |
| Fluid Depth  | 150 ± 5 mm |  |  |  |  |
|  |            |  |  |  |  |

An Area Scan with an area extending beyond the device was used to locate the candidate maximas within 2dB of the global maxima.

A Zoom Scan centered over the peak SAR location(s) determined by the Area Scan was used to determine the 1-gram and 10-gram peak spatial-average SAR

## 13.8 Scan Resolution 5GHz to 6GHz

| Scan Resolution 5GHz to 6GHz  |            |  |  |  |  |
|---|------------|--|--|--|--|
| Maximum distance from the closest measurement point to phantom surface: | 4 ± 1 mm   |  |  |  |  |
| (Geometric Center of Probe Center)                                      |            |  |  |  |  |
| Maximum probe angle normal to phantom surface.                          | 5° ± 1°    |  |  |  |  |
| (Flat Section ELI Phantom)  | 5° ± 1°    |  |  |  |  |
| Area Scan Spatial Resolution ΔX, ΔΥ                                     | 10 mm      |  |  |  |  |
| Zoom Scan Spatial Resolution ΔX, ΔΥ                                     | 4 mm       |  |  |  |  |
| Zoom Scan Spatial Resolution ∆Z   | 2 mm       |  |  |  |  |
| (Uniform Grid)  | 2 111111   |  |  |  |  |
| Zoom Scan Volume X, Y, Z  | 22 mm      |  |  |  |  |
| Phantom   | ELI        |  |  |  |  |
| Fluid Depth   | 100 ± 5 mm |  |  |  |  |

An Area Scan with an area extending beyond the device was used to locate the candidate maximas within 2dB of the global maxima.

A Zoom Scan centered over the peak SAR location(s) determined by the Area Scan was used to determine the 1-gram and 10-gram peak spatial-average SAR

<sup>(1)</sup> The Effective Degrees of Freedom is > 30

Therefore a coverage factor of k=2 represents an approximate confidence level of 95%.

<sup>(2)</sup> The SAR Value is compensated for Drift

<sup>(3)</sup> SAR Power Scaling not Required

Prior to the SAR evaluations, system checks were performed on the planar section of the phantom and a SPEAG validation dipole in accordance with the procedures described in IEEE 1528-2013, FCC KDB 846224 and IEC 62209-1.

The dielectric parameters of the simulated tissue mixture were measured prior to the system performance check using a Dielectric Probe Kit and a Network Analyzer.

The forward power was applied to the dipole and the system was verified to a tolerance of +10% from the system manufacturer's dipole calibration target SAR value.

The forward power applied was same forward power applied by the calibration lab during the calibration of this validation source.

The ELI V5.0 phantom is an elliptical planar fiberglass shell phantom with a shell thickness of 2.0mm +/- .2mm at the planar area. This phantom conforms to OET Bulletin 65, Supplement C, IEEE 1528-2013, IEC 62209-1 and IEC 62209-2.

**ELI Phantom** 

#### **Device Positioner Specification**

The DASY device positioner has two scales for device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear openings). The plane between the ear openings and the mouth tip has a rotation angle of 65°. The bottom plate contains three pair of bolts for locking the device holder. The device holder positions are adjusted to the standard measurement positions in the three sections.

### **APPENDIX A - SYSTEM VERIFICATION PLOTS**

DUT: CLA-150; Type: CLA-150; Serial: 4007

Procedure Name: SPC 150H Input=1.0W, Target[3.5][3.89][4.3]W/kg 2 2 2

Communication System: UID 0, CW (0); Frequency: 150 MHz; Duty Cycle: 1:1 Medium parameters used: f = 150 MHz;  $\sigma = 0.7 \text{ S/m}$ ;  $\epsilon_r = 51.54$ ;  $\rho = 1000 \text{ kg/m}^3$ 

Phantom section: Flat Section

Date/Time: 11/8/2021 11:08:31 AM

### DASY5 Configuration:

Probe: EX3DV4 - SN3600; ConvF(9.45, 9.45, 9.45) @ 150 MHz; Calibrated: 4/28/2021

• Sensor-Surface: 4mm (Mechanical Surface Detection)

Electronics: DAE4 Sn353; Calibrated: 4/22/2021

Phantom: ELI V5.0 (20deg probe tilt); Type: QD OVA 002 Ax; Serial: 1234

Measurement SW: DASY52, Version 52.10 (3); SEMCAD X Version 14.6.13 (7474)

SPC/SPC 150H Input=1.0W, Target[3.5][3.89][4.3]W/kg 2 2 2/Area Scan (9x9x1): Measurement grid: dx=15mm, dv=15mm

Maximum value of SAR (measured) = 3.73 W/kg

SPC/SPC 150H Input=1.0W, Target[3.5][3.89][4.3]W/kg 2 2 2/Zoom Scan (5x5x7)/Cube 0: Measurement grid:

dx=7.5mm, dy=7.5mm, dz=5mm

Reference Value = 73.56 V/m; Power Drift = -0.06 dB

Peak SAR (extrapolated) = 5.60 W/kg

SAR(1 g) = 3.64 W/kg; SAR(10 g) = 2.41 W/kg Ratio of SAR at M2 to SAR at M1 = 67.6% Maximum value of SAR (measured) = 3.91 W/kg

### APPENDIX B - MEASUREMENT PLOTS OF MAXIMUMUM MEASURED SAR

#### Plot B3

DUT: MHS75 - UT664ZV; Type: Sample; Serial: IMEI Number

Procedure Name: B3-UT664ZV, Body Config- Back Side (Belt Clip), Pwr 6W,157.425MHz

Communication System: UID 0, FM (0); Frequency: 157.425 MHz; Duty Cycle: 1:1

Medium parameters used (interpolated): f = 157.425 MHz;  $\sigma = 0.707 \text{ S/m}$ ;  $\varepsilon_r = 50.152$ ;  $\rho = 1000 \text{ kg/m}^3$ 

Phantom section: Flat Section

Date/Time: 11/9/2021 5:18:34 PM

#### DASY5 Configuration:

Probe: EX3DV4 - SN3600; ConvF(9.45, 9.45, 9.45) @ 157.425 MHz; Calibrated: 4/28/2021

- Sensor-Surface: 1.4mm (Mechanical Surface Detection (Locations From Previous Scan Used)), Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn353; Calibrated: 4/22/2021
- Phantom: ELI V5.0 (20deg probe tilt); Type: QD OVA 002 Ax; Serial: 1234
- Measurement SW: DASY52, Version 52.10 (3); SEMCAD X Version 14.6.13 (7474)

**150B/B3-UT664ZV**, **Body Config- Back Side (Belt Clip)**, **Pwr 6W,157.425MHz/Area Scan (8x18x1)**: Measurement grid: dx=15mm, dy=15mm

Info: Interpolated medium parameters used for SAR evaluation.

Maximum value of SAR (measured) = 2.63 W/kg

#### 150B/B3-UT664ZV, Body Config- Back Side (Belt Clip), Pwr 6W,157.425MHz/Zoom Scan (5x5x7)/Cube 0:

Measurement grid: dx=7.5mm, dy=7.5mm, dz=5mm Reference Value = 50.06 V/m; Power Drift = -0.14 dB Peak SAR (extrapolated) = 3.13 W/kg

SAR(1 g) = 2.38 W/kg; SAR(10 g) = 1.72 W/kg

Smallest distance from peaks to all points 3 dB below = 22.5 mm

Ratio of SAR at M2 to SAR at M1 = 78.7%

Info: Interpolated medium parameters used for SAR evaluation.

Maximum value of SAR (measured) = 2.44 W/kg

45461697 R1.0 10 December 2021

Plot F4

DUT: MHS75 - UT664ZV; Type: Sample; Serial: IMEI Number

Procedure Name: F4-UT664ZV, Face Config- Front Side(25mm), Pwr 6W,156.15MHz

Communication System: UID 0, FM (0); Frequency: 156.15 MHz; Duty Cycle: 1:1

Medium parameters used (interpolated): f = 156.15 MHz;  $\sigma = 0.706 \text{ S/m}$ ;  $\epsilon_r = 50.39$ ;  $\rho = 1000 \text{ kg/m}^3$ 

Phantom section: Flat Section

Date/Time: 11/9/2021 7:21:07 PM

#### **DASY5** Configuration:

Probe: EX3DV4 - SN3600; ConvF(9.45, 9.45, 9.45) @ 156.15 MHz; Calibrated: 4/28/2021

- Sensor-Surface: 1.4mm (Mechanical Surface Detection (Locations From Previous Scan Used)), Sensor-Surface:
   4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn353; Calibrated: 4/22/2021
- Phantom: ELI V5.0 (20deg probe tilt); Type: QD OVA 002 Ax; Serial: 1234
- Measurement SW: DASY52, Version 52.10 (3); SEMCAD X Version 14.6.13 (7474)

150B/F4-UT664ZV, Face Config- Front Side(25mm), Pwr 6W,156.15MHz/Area Scan (8x18x1): Measurement grid: dx=15mm, dy=15mm

Info: Interpolated medium parameters used for SAR evaluation.

Maximum value of SAR (measured) = 2.65 W/kg

150B/F4-UT664ZV, Face Config- Front Side(25mm), Pwr 6W,156.15MHz/Zoom Scan (5x5x7)/Cube 0: Measurement

grid: dx=7.5mm, dy=7.5mm, dz=5mm

Reference Value = 53.90 V/m; Power Drift = -0.26 dB

Peak SAR (extrapolated) = 2.42 W/kg

SAR(1 g) = 1.88 W/kg; SAR(10 g) = 1.42 W/kg

Ratio of SAR at M2 to SAR at M1 = 79.5%

Info: Interpolated medium parameters used for SAR evaluation.

Maximum value of SAR (measured) = 1.99 W/kg
