7.2.3 Test Method and Test Setup (Diagrammatic illustration)

Step 1:

In order to obtain the maximum emission, the EUT was placed at the height 1.5 m on the non-conducted support and was varying at three orthogonal axes, at the distance 3 m from the receiving antenna and rotated around 360 degrees.

The receiving antenna height was varied from 1 m to 4 m.

The EUT on the table was placed to be maximum emission against at the receiving antenna polarized (vertical and horizontal).

Then the meter reading of the spectrum analyzer at the maximum emission was A dB(μV).

Step 2:

The EUT was replaced to substitution antenna at the same polarized under the same condition as step 1.

The RF power was fed to the transmitting antenna through the RF amplifier from the signal generator.

In order to obtain the maximum emission level, the height of the receiving antenna was varied from 1 m to 4 m.

The level of maximum emission was A dB(μV), same as the recorded level in the step 1.

Then the RF power into the substitution horn antenna was P (dBm).

The ERP/EIRP output power was calculated in the following equation.

$$\text{ERP (dBm)} = \text{P (dBm)} - \text{Balun loss of the tuned dipole antenna (dB)} + \text{Cable loss (dB)}$$

$$\text{EIRP (dBm)} = \text{P (dBm)} + \text{Gh (dBi)}$$

where, Gh (dBi) : Gain of the substitution horn antenna.

NOTES

- The spectrum was checked from 9 kHz to 10 GHz.
- Applied limits : -13.0 [dBm] = $10\log(TP[mW]) - (43 + 10\log(tp[W])) = 10\log(TP[mW]) - (43 + (10\log(TP[mW]) - 30))$
where, $tp[W] = TP[mW] / 1000$: Transmitter power at antenna terminal
- The correction factor is shown as follows:
Corr. Factor [dB] = Cable Loss + 10dB Pad Att. [dB] (9 kHz - 1.2 GHz)
Corr. Factor [dB] = Cable Loss + 10dB Pad Att. + High Pass Filter Loss (D-94) [dB] (over 1.2 GHz)

7.7.3 Test Method and Test Setup (Diagrammatic illustration)

Step 1) The spurious radiation for transmitter were measured at the distance 3 m away from the EUT which was placed on a non-conducted support 0.8 m in height and was varying at three orthogonal axes. The receiving antenna was oriented for vertical polarization and varied from 1 m to 4 m until the maximum emission level was detected on the measuring instrument. The EUT was rotated 360 degrees until the maximum emission was received. The measurement was also repeated with the receiving antenna in the horizontal polarization.

This test was carried out using the half-wave dipole antenna for up to 1GHz and using the horn antenna for above 1 GHz.

Step 2)

A) Up to 1 GHz

The ERP measurement was carried out with according to Step 2 in Clause 7.2.3. Then the RF power in the substitution antenna half-wave dipole antenna for up to 1 GHz and the substitution horn antenna for above 1 GHz.

The ERP is calculated in the following equation.

$$\text{ERP(dBm)} = P(\text{dBm}) - (\text{Balun Loss of the half-wave dipole Ant. (dB)}) + \text{Cable Loss (dB)}$$

B) Above 1 GHz

The ERP is calculated from the maximum emission level by the following formula.

$$\frac{e^2}{120\pi} = \frac{\text{eirp}}{4\pi d^2} \quad \text{----(Eq.1)}$$

$$\text{erp} = \text{eirp} - Gd \quad \text{----(Eq.2)}$$

Where, $e[V/m]$: Field Strength at measuring distance($d=3m$)

$\text{eirp}[W]$: Equivalent Isotropic Radiated Power

$\text{erp}[W]$: Effective Radiated Power

$Gd(dBi)$: Gain of the substitution half-wave dipole antenna(2.15dBi)

$$\text{eirp} = \frac{(de)^2}{30} = \frac{3}{10}e^2$$

$$\therefore 10 \log(\text{eirp}) = 20 \log(e) + 10 \log(3/10) = 20 \log(e) - 5.23$$

$$10 \log(\text{eirp}) = \text{EIRP}[dBm] - 30$$

$$20 \log(e) = E[dB(\mu V/m)] - 120$$

$$\therefore \text{EIRP} = E - 120 + 30 - 5.23 = E - 95.23$$

$$\therefore \text{ERP}[dBm] = \text{EIRP} - 2.15 = E - 97.38$$

The respective calculated ERP of the spurious and harmonics were compared with the ERP of fundamental frequency by specified attenuation limits, $43+10\log_{10}(TP \text{ in watt})[dB]$. Where, TP = Transmitter power at the ANT OUT under test configuration as the hands free unit used.

Radiated Emission 30 MHz to 1000 MHz

Radiated Emission above 1 GHz

NOTE

The antenna height is scanned depending on the EUT's size and mounting height.

7.8.3 Test Method and Test Setup (Diagrammatic illustration)

Frequency Stability versus Temperature

The EUT was placed in an environmental chamber and was tested in the range from –30 to +50 degrees Celsius. The EUT was stabilized at each temperature. The power (4.0VDC) supplied was applied to the transmitter and allowed to stabilize for 10 minutes. The transmitting frequency was measured at startup and 2 minutes, 5 minutes and 10 minutes after startup. This procedure was repeated from –30 to +50 degrees Celsius at the interval of 10 degrees.

Frequency Stability versus Power Supply Voltage

The EUT was placed in an environmental chamber and was tested at the temperature of +20 degrees Celsius. The EUT was stabilized at the temperature. The power (4.0VDC) and the power (3.7VDC, the ending voltage) was applied to the EUT allowed to stabilize for 10 minutes. The transmitting frequency was measured at startup and 2 minutes, 5 minutes and 10 minutes after startup.
