

## 7. Emission Masks

### 7.1 Test Specification

FCC Part 90, Subpart I, Section 90.210(b)

### 7.2 Test Procedure

(Temperature (21°C)/ Humidity (59%RH))

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator, an appropriate coaxial cable and DC block.

(max total loss= 31.0/36.0 dB).

Three operational frequencies (low, mid and high) were evaluated for all BWs (5MHz, 10MHz, 15MHz, 20MHz) for each modulation type (QPSK, 16QAM and 64QAM).

### 7.3 Test Limit

For transmitters that are equipped with an audio low-pass filter, the power of any emission must be attenuated below the unmodulated carrier power (P) as follows:

- (1) On any frequency removed from the assigned frequency by more than 50 percent, but not more than 100 percent of the authorized bandwidth: At least 25dB.
- (2) On any frequency removed from the assigned frequency by more than 100 percent, but not more than 250 percent of the authorized bandwidth: At least 35dB.
- (3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least  $43 + 10 \log (P)$  dB.

\*NOTE: the emission mask limit was reduced by 10dB to compensate for the RBW.

### 7.4 Test Results

JUDGEMENT:        Passed

## 8. Conducted Transmitter Unwanted Emissions

### 8.1 Test Specification

RSS-197, Issue 1: 2010, Section 5.7  
FCC, Part 90, Subpart Z, Section 90.1323

### 8.2 Test Procedure

(Temperature (21°C)/ Humidity (59%RH))

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator, an appropriate coaxial cable and DC block. (max total loss= 32.4 dB).

Top and bottom operational frequencies were tested for all BWs (5, 10, 15, 20MHz) for each modulation type (QPSK, 16QAM and 64QAM).

The testing was performed in low population power mode as the “worst case”. Scanning was performed from 10.0MHz until 37.0GHz.

### 8.3 Test Limit

Power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at  $43 + 10 \log (P)$  dB, yielding -13dBm.

### 8.4 Test Results

JUDGEMENT: Passed

## 9. Radiated Unwanted Emissions

### 9.1 Test Specification

RSS 197, Issue 1: 2010, Section 5.7  
FCC, Part 90, Subpart Z, Section 90.1323

### 9.2 Test Procedure

The test method was based on ANSI/TIA-603-D: 2010, Section 2.2.12  
Unwanted Emissions: Radiated Spurious.

The E.U.T. operation mode and test set-up are as described in Section 2 of this report.

#### **For measurements between 0.009MHz-30MHz:**

The E.U.T was tested inside the shielded room at a distance of 3 meters and the E.U.T was placed on a non-metallic table, 1.5 meters above the ground. The frequency range 0.009MHz-30MHz was scanned. The readings were maximized by the turntable azimuth between 0-360°, and the antenna polarization. The emissions were measured at a distance of 3 meters.

#### **For measurements between 30.0MHz-1.0GHz:**

A preliminary measurement to characterize the E.U.T was performed inside the shielded room at a distance of 3 meters, using peak detection mode and broadband antennas. The preliminary measurements produced a list of the highest emissions. The E.U.T was then transferred to the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground. The frequency range 30.0MHz -1.0GHz was scanned and the list of the highest emissions was verified and updated accordingly.

The readings were maximized by adjusting the antenna height between 1-4 meters, the turntable azimuth between 0-360°, and the antenna polarization. The emissions were measured at a distance of 3 meters.

#### **For measurements between 1.0GHz-37.0GHz:**

The E.U.T was tested inside the shielded room at a distance of 3 meters and the E.U.T was placed on a non-metallic table, 1.5 meters above the ground. The frequency range 1.0GHz -37.0GHz was scanned. The readings were maximized by the turntable azimuth between 0-360°, and the antenna polarization. The emissions were measured at a distance of 3 meters.

The E.U.T. was replaced by a substitution antenna driven by a signal generator. The height was readjusted for maximum reading. The signal generator level was adjusted to obtain the same reading on the EMI receiver as in step (a).

The signals observed in step (a) were converted to radiated power using:

$$P_d(\text{dBm}) = P_g(\text{dBm}) - \text{Cable Loss (dB)} + \text{Substitution Antenna Gain (dBd)}$$

$P_d$  = Equivalent Radiated Power (result).

$P_g$  = Signal generator output level.

The tests were performed in 2 operational frequencies: bottom and top at 5M, 10M, 15M and 20MHz CBW (64QAM modulation as the “worst case “for radiated emission). Testing was performed with the E.U.T. transmitting maximum power at the RF port in low population power mode.

The table below describe only the results with the highest radiation.

### **9.3 Test Limit**

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least  $43 + 10 \log (P)$  dB, yielding  $-13\text{dBm}$ .

### **9.4 Test Results**

JUDGEMENT:                      Passed by 25.7 dB (5MHz Bandwidth)  
    Passed by 25.6 dB (10 MHz Bandwidth)

The E.U.T met the requirements of the RSS-197, Issue 1:2010, Section 5.7 specification.

For additional information see details in *Figure 313* to *Figure 314*.

## 10. Receiver Spurious Emissions

### 10.1 Test Specification

RSS 197, Issue 1: 2010, Section 5.8  
RSS Gen, Issue 4:2014, Section 7.1.3

### 10.2 Test Procedure

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through, an appropriate coaxial cable, and DC block. (total loss= 4.0 dB).  
Scanning was performed between 10MHz until 20.0GHz.  
2 ports were tested.

### 10.3 Test Limit

Receiver spurious emissions shall not exceed -57.0dBm below 1.0 GHz, and -53.0dBm above 1.0 GHz at the antenna connector.

### 10.4 Test Results

JUDGEMENT:                      Passed

The E.U.T met the requirements of RSS 197, Issue 1: 2010, Section 5.8 and RSS Gen, Issue 4:2014, Section 7.1.3 specification.

For additional information see details in *Figure 316* to *Figure 319*.

## 11. Antenna Gain/Information

15 dBi antenna gain

**4000D-F35**

### 3300-3800MHz CPE Antenna (Vertical and Horizontal Polarization)

The 4000D-F35 is a broadband, dual polarized, dual port. Emphasis has been placed on rugged mechanical construction, styling, small dimensions plus superior electrical performance. This antenna is designed to meet the most stringent environmental conditions.

#### Features:

- Good radiation patterns.
- Wide bandwidth stable gain across the band.
- Flying leads allowing easy connection to CPE.
- UV Stabilized radome.

#### Applications:

- WIMAX or LTE patch antenna
- 2x2 and 4x2 MIMO application

#### Electrical specifications:

Frequency Range:	3300MHz - 3800MHz
Gain:	15±1 dBi
Return Loss:	< - 10 dB
Polarization:	Vertical and Horizontal
Isolation:	> 28 dB
Front to Back Ratio:	> 25 dB
Horizontal 3dB BW:	36°
Vertical 3dB BW:	24°
Power handling:	50W

#### Mechanical Specifications:

Connector Type:	2 x MCX Male
Connector Location:	Flying Lead, Back Side
Dimensions (LxWxD):	203 x 203 x 25 mm
Weight:	0.428kg
Radome:	UV-Stabilized PC
