

Engineering and Testing for EMC and Safety Compliance

**CERTIFICATION APPLICATION REPORT
FCC PART 90 & INDUSTRY CANADA RSS-119**

Test Lab: Rhein Tech Laboratories, Inc. Phone: 703-689-0368 360 Herndon Parkway Fax: 703-689-2056 Suite 1400 Web: www.rheintech.com Herndon, VA 20170 Contact: FCCINFO@rheintech.com		Applicant: E. F. Johnson Phone: 507-835-6276 299 Johnson Ave. Fax: 507-835-6666 P.O. Box 1249 Waseca, MN 56093-0514 Contact: Ann Jones	
FCC ID:	ATH2424130	FRN NUMBER:	0005-8136-88
MODEL:	242-413x-xxx	RTL WORK ORDER NUMBER:	2004209
EQUIPMENT TYPE:	UHF-L PTT	RTL QUOTE NUMBER:	QRTL04-375
DATE OF TEST REPORT:	December 19, 2004		
FCC Classification:	☒ TNF – Licensed Non-Broadcast Transmitter Held to Face		
FCC Rule Part(s):	Part 90: Private Land Mobile Radio Services		
Industry Canada Standard:	RSS-119: Land Mobile and Fixed Radio Transmitters and Receivers, 27.41MHz to 960MHz		
Frequency Range (MHz)	Output Power (W)	Frequency Tolerance (PPM, %, or Hz)	Emission Designator
380 – 470	4.7	4 PPM	11K0F3E
380 – 470	4.7	4 PPM	16K0F3E
380 – 470	4.7	4 PPM	8K10F1E
380 – 470	4.7	4 PPM	8K10F1D

We, the undersigned, hereby declare that the equipment tested and referenced in this report conforms to the identified standard(s) as described in this test report. No modifications were made to the equipment during testing in order to achieve compliance with these standards.

Furthermore, there was no deviation from, additions to or exclusions from the FCC Part 2, FCC Part 90, Industry Canada RSS-119, ANSI C63.2, ANSI/TIA-603-B-2002 and ANSI/TIA/EIA 603-1.

1 GENERAL INFORMATION

1.1 SCOPE

FCC Rules Part 90 (Subpart K): This subpart sets forth special requirements applicable to the use of certain frequencies or frequency bands.

Industry Canada RSS-119: This document sets out standards for radio transmitters and receivers for the land mobile and fixed services in bands allocated within the 27.41 MHz to 960 MHz range.

All measurements contained in this application were conducted in accordance with the FCC Rules and Regulations CFR47 Part 90, Industry Canada RSS-119 and ANSI/TIA-603-B-2002 Land Mobile FM or PM Communications Equipment Measurement and Performance Standards. The measurement instrumentation conforms to the ANSI C63.2; standard for EMI and Field Strength Instrumentation. Calibration checks are performed regularly on the instruments, and all accessories including high pass filter, coaxial attenuator, preamplifier and cables.

1.2 TEST FACILITY

The open area test site and conducted measurement facility used to collect the radiated data is located at 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170. This site has been fully described in a report and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing (ANSI C63.2).

1.3 RELATED SUBMITTAL(S)/GRANT(S)

This is an original application for Certification. A DoC report is on file for the receiver section and digital interface for the EUT.

2 EQUIPMENT INFORMATION

2.1 TEST SYSTEM DETAILS

The test sample was received on December 3, 2004. The FCC Identifiers for all equipment, plus descriptions of all cables used in the tested system are:

6 FCC PART 2 §2.1047 (A): MODULATION CHARACTERISTICS - AUDIO FREQUENCY RESPONSE

6.1 TEST PROCEDURE

ANSI/TIA-603-B-2002, section 2.2.6. The audio frequency response is the degree of closeness to which the frequency deviation of the transmitter follows a prescribed characteristic. The input audio level at 1000 Hz is set to produce 20% of the rated system deviation. This point is shown as the 0 dB reference level, noted DEVref. The audio signal generator was varied from 100 Hz to 5 kHz with the input level held constant. The deviation in kHz was recorded using a modulation analyzer as DEVfreq. The response in dB relative to 1 kHz was calculated as follows: Audio Frequency Response = 20 LOG (DEVfreq/DEVref)

DATE OF TEST

8 FCC PART 2 §2.1047 (B): MODULATION CHARACTERISTICS - MODULATION LIMITING

8.1 TEST PROCEDURE

ANSI/TIA-603-B-2002, section 2.2.3

The transmitter is adjusted for full rated system deviation. The audio input level is adjusted for 60% of rated system deviation at 1000 Hz. Using this level as a reference (0 dB) the audio input level is varied from the reference to a level +20 dB above it and -20 dB under it, for modulation frequencies of 300Hz, 1000 Hz, and 2500 Hz. The system deviation obtained as a function of the input level is recorded. Both Positive and Negative Peak deviations were recorded.

9 OCCUPIED BANDWIDTH - §2.1049 / RSS-119 §6.4

9.1 OCCUPIED BANDWIDTH - §2.1049 TEST PROCEDURE

The antenna output terminal of the EUT was connected to the input of a 50W spectrum analyzer through a matched 40 dB attenuator. The radio transmitter was operating at maximum output power with and without internal data modulation. 100% of the in-band modulation was below the specified mask. Specified Limits:

(b) *Emission Mask B*. For transmitters that are equipped with an audio low-pass filter pursuant to §90.211(a), the power of any emission must be below the unmodulated carrier power (P) as follows:

- (1) On any frequency removed from the assigned frequency by more than 50 percent, but not more than 100 percent of the authorized bandwidth: At least 25 dB.
- (2) On any frequency removed from the assigned frequency by more than 100 percent, but not more than 250 percent of the authorized bandwidth: At least 35 dB.
- (3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized bandwidth: At least $43 + 10 \log (P)$ dB.

(d) *Emission Mask D—12.5 kHz channel bandwidth equipment*. For transmitters designed to operate with a 12.5 kHz channel bandwidth, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:

- (1) On any frequency from the center of the authorized bandwidth f_0 to 5.625 kHz removed from f_0 : Zero dB.
- (2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 5.625 kHz but no more than 12.5 kHz: At least $7.27(f_d - 2.88 \text{ kHz})$ dB.
- (3) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 12.5 kHz: At least $50 + 10 \log (P)$ dB or 70 dB, whichever is the lesser attenuation.

10 SPURIOUS EMISSIONS AT ANTENNA TERMINAL - §2.1051 / RSS-119 §6.3

10.1 SPURIOUS EMISSIONS AT ANTENNA TERMINAL - §2.1051 TEST PROCEDURE

The level of the various conducted spurious frequencies was measured by means of a calibrated spectrum analyzer. The antenna output terminal of the EUT was connected to the input of a 50 Ω spectrum analyzer through a notch filter. The transmitter was operating at maximum power.

11 RADIATED SPURIOUS AND HARMONIC EMISSIONS - §2.1053 / RSS-119 §6.3

11.1 RADIATED SPURIOUS AND HARMONIC EMISSIONS - §2.1053

Radiated and harmonic emissions were measured at a 3 meter outdoor site. The EUT was placed on the turntable with the transmitter transmitting into a non-radiating load. A receiving antenna located 3 meters from the turntable received any signal radiated from the transmitter and its operating accessories. The receiving antenna was varied from 1 to 4 meters and the polarization was varied to determine the worst-case emission level. The EUT was measured in three orthogonal planes with the receive antenna positioned in both horizontal and vertical polarities. The EUT was replaced by a substitution antenna and a signal generator level was obtained by correcting for the cable loss and transmitting gain antenna (referenced to a half-wave dipole). This level was checked using a power divider at the transmitting antenna to assure there was no impedance mismatch between the 50 ohm signal generator and the transmitting antenna.

12 FREQUENCY STABILITY / TEMPERATURE VARIATION - §2.1055 / RSS-119 §7

12.1 MEASUREMENT METHOD:

The frequency stability of the transmitter was measured by:

1. Temperature: The temperature was varied from -30°C to +60°C at intervals no more than 10°C throughout the temperature range using an environmental chamber. A period of time sufficient to stabilize all of the components in the equipment shall be allowed prior to each frequency measurement.
2. Primary Supply Voltage: The primary supply voltage was varied from 85% to 115% of the voltage normally at the input to the device or at the power supply terminals if cables are not normally supplied. The EUT was tested down to the battery endpoint.

12.2 TIME PERIOD AND PROCEDURE:

1. The carrier frequency of the transmitter was measured at room temperature (25°C to 27°C to provide a reference).
2. The equipment was subjected to a period of 1 hour to stabilize at -30°C without any power applied.
3. After the stabilization period at -30°C, the measurement of the carrier frequency of the transmitter was made within a three-minute interval after applying power to the transmitter.
4. Frequency measurements were made at 10°C intervals up to +50°C. A minimum period of 1/2 hour was provided to allow stabilization of the equipment at each temperature level.

12.3 FREQUENCY TOLERANCE

The minimum frequency stability shall be 5 ppm.

13 FCC PART 90 §90.214 / RSS-119 §6.5: TRANSIENT FREQUENCY BEHAVIOR

13.1 TRANSIENT FREQUENCY BEHAVIOR TEST PROCEDURE

ANSI/TIA-603-B-2002, section 2.2.19

13.2 TRANSIENT FREQUENCY BEHAVIOR LIMITS

TABLE 13-1: REQUIREMENTS FOR EUT WITH 25 KHZ CHANNEL SPACING

Time Intervals (*)(**)	Maximum Frequency Difference (***)	150-174 MHz	421-512 MHz
t1(****)	± 25 kHz	5.0 mSec	10.0 mSec
t2	± 12.5 kHz	20.0 mSec	25.0 mSec
t3(****)	± 25 kHz	5.0 mSec	10.0 mSec

TABLE 13-2: REQUIREMENTS FOR EUT WITH 12.5 KHZ CHANNEL SPACING

Time Intervals (*)(**)	Maximum Frequency Difference(***)	150-174 MHz	421-512 MHz
t1(****)	± 12.5 kHz	5.0 mSec	10.0 mSec
t2	± 6.25 kHz	20.0 mSec	25.0 mSec
t3(****)	± 12.5 kHz	5.0 mSec	10.0 mSec

(*) t_{on} is the instant when a 1 kHz test signal is completely suppressed, including any capture time due to phasing.

t_1 is the time period immediately following t_{on} .

t_2 is the time period immediately following t_1 .

t_3 is the time period from the instant when the transmitter is turned off until t_{off} .

t_{off} is the instant when the 1 kHz test signal starts to rise.

(**) During the time from the end of t_2 to the beginning of t_3 , the frequency difference must not exceed the limits specified in §90.213.

(***) The difference between the actual transmitter frequency and the assigned transmitter frequency.

(****) If the transmitter carrier output power rating is 6 watts or less, the frequency difference during this time period may exceed the maximum frequency difference for this time period.

Maximum frequency difference between time T2 and T3: Calculation for Channel 5:

The frequency stability is required to be 5 PPM.

4 div. on scope represents 12.5 kHz for narrow band channel.

Therefore, 425 MHz times 5 PPM times +/- 4 Divisions divided by 12.5 kHz equals +/- 0.68 division. 0.68 Div. corresponds to 2.125 kHz

TABLE 13-3: TRANSIENT FREQUENCY BEHAVIOR TEST EQUIPMENT

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Cal Due Date

13.3 TRANSIENT FREQUENCY BEHAVIOR TEST DATA

PLOT 13-1: (ON TIME) – CHANNEL 5: 425 MHZ (12.5 KHZ NARROWBAND)

Carrier ON time:

Power: 4.7 W

Channel 5: 425 MHz NB (12.5 kHz)

RF Signal Generator: Modulation 12.5 kHz deviation

Timebase: 10 ms/div

Trigger: On negative edge of Ch 2, level -11.6mV

Ch 1: 250mV/div, Probe 1.000:1

Vertical scale: +/- 4 div. corresponds to +/- 12.5 kHz

PLOT 13-2: (OFF TIME) – CHANNEL 5: 425 MHZ (12.5 KHZ NARROWBAND)

Carrier ON time:
Power: 4.7 W
Channel 5: 425 MHz NB (12.5 kHz)
RF Signal Generator: Modulation 12.5 kHz deviation

Timebase: 10 ms/div
Trigger: On positive edge of Ch 2, level 23.2 mV
Ch 1: 250mV/div, Probe 1.000:1
Vertical scale: +/- 4 div. corresponds to +/- 12.5 kHz

PLOT 13-3: (ON TIME) – CHANNEL 2: 425 MHZ (25 KHZ WIDEBAND)

Carrier ON time:

Power: 4.7 W

Channel 2: 425 MHz WB (25 kHz)

RF Signal Generator: Modulation 25 kHz deviation

Timebase: 10 ms/div

Trigger: On negative edge of Ch 2, level -2.7 mV

Ch 1: 500mV/div, Probe 1.000:1

Vertical scale: +/- 4 div. corresponds to +/- 25 kHz

PLOT 13-4: (OFF TIME) – CHANNEL 2: 425 MHZ (25 KHZ WIDEBAND)

Carrier OFF time:
Power: 4.7 W
Channel 2: 425 MHz WB (25 kHz)
RF Signal Generator: Modulation 25 kHz deviation

Timebase: 10 ms/div
Trigger: On positive edge of Ch 2, level 23.2 mV
Ch 1: 500mV/div, Probe 1.000:1
Vertical scale: +/- 4 div. corresponds to +/- 25 kHz

14 FCC PART 2.202: NECESSARY BANDWIDTH AND EMISSION BANDWIDTH

Type of Emission: F3E and F1E

Necessary Bandwidth and Emission Bandwidth calculation

The 25 kHz Analog modulation necessary bandwidth: $B_n = 16K0F3E$

The 12.5 kHz Analog modulation necessary bandwidth: $B_n = 11K0F3E$

The P25 Digital modulation necessary bandwidth: $B_n = 8K10F1E$

Calculation:

Max modulation (M) in kHz: 3

Max deviation (D) in kHz for (25 KHz channel spacing analog): 5

Max deviation for (D) in kHz for (12.5 KHz channel spacing): 2.5

Constant factor (K): 1

$$B_{n(25\text{KHz analog})} = 2 \times M + 2 \times DK = (2 \times 3) + (2 \times 5 \times 1) = 16 \text{ KHz}$$

$$B_{n(12.5\text{KHz})} = 2 \times M + 2 \times DK = (2 \times 3) + (2 \times 2.5 \times 1) = 11 \text{ KHz}$$

For P25 digital (with a 9600 bps data rate and peak symbol deviation of +/- 1.65 kHz)

where R= data rate in bps, D= peak deviation in Hz, and S= number of states in each symbol

$$B_n = [R / \log_2(S)] + 2DK, \text{ where } K=1$$

$$B_{n(P25 \text{ Digital})} = [9600 / \log_2(4)] + 2(1650)(1) = 8.1 \text{ kHz.}$$

15 CONCLUSION

The data in this measurement report shows that E.F. Johnson Model 242-413x-xxx, FCC ID: ATH2424130, complies with all the applicable requirements of Parts 2 and 90 of the FCC Rules and Industry Canada RSS-119.
