(3) Meet 15.202 requirement. Please check below.

A master device is defined as a device operating in a mode in which has the capability to transmit without receiving an enabling signal. In this mode it is able to select a channel and initiate a network by sending enabling signals to other device.

A client device is defined as a device operating in a mode in which the transmissions of the device are under control of the master. A device in client mode is not able to initiate a network.

This information when programmed into the EEPROM will not be accessible and can not be changed by the end user.
