Subject: Response to your query of 1/6/99

We are requesting an 830 mw rating or a minimum rating of 800 mw. The 830 mw value represents the typical power of the units off the production line. The EIRP value you recommend is lower than all the data supporting and does not represent what we are typically getting from production.

The original data we sent you along with the most recent data supports our request. The most recent data sent has two power measurements for two different mobiles. The second measurement more closely matches the original power measurement of 29.2 (832mw) and the data supporting SAR, radiated receiver and transmitter emission, and the remainder of the original filing.

If you have any questions, feel free to contact me.

Sincerely,

Jim Sponsler
