<b>Requirement:</b>	The associated receiver has the ability to shift frequencies in synchronisation with the transmitted signals.	
Receiver hopping Capability		
The receiver is waiting the signal from TX with dedicated packet address (8bytes).		
Once the receiver received the signal from TX, RX starts to parse the packet and fetch the 2 kinds of data.		
The former data describes the timing data, and the latter is random seeds to generate the hopping pattern.		
Then RX starts generating hopping patter at first, and wait the TX signal again to sync the hopping.		
After the above procedure, RX can easily sync the hopping pattern.
