CLU1040BHMBB, CLU1043BHLBA/CLP1043RL

**Serial Number(s):** 158TTS0019

**Classification:** Occupational/Controlled FCC ID: AZ489FT4945; 450-470 MHz

IC ID: 109U-89FT4945

**ISED Test Site** 

**Registration:** 109AK

**FCC Test Firm** 

823256 Registration

**Number:** 

The test results clearly demonstrate compliance with FCC Occupational/Controlled RF Exposure limits of 8 W/kg averaged over 1 gram per the requirements of FCC 47 CFR § 2.1093.

Based on the information and the testing results provided herein, the undersigned certifies that when used as stated in the operating instructions supplied, said product complies with the national and international reference standards and guidelines listed in section 4.0 of this report. This report shall not be reproduced without written approval from an officially designated representative of the Motorola Solutions Inc EME Laboratory. I attest to the accuracy of the data and assume full responsibility for the completeness of these measurements. This reporting format is consistent with the suggested guidelines of the TIA TSB-150 December 2004. The results and statements contained in this report pertain only to the device(s) evaluated.

#### 1.0 Introduction

This report details the utilization, test setups, test equipments, and test results of the Specific Absorption Rate (SAR) measurements performed at the Motorola Solutions Inc. EME Test Laboratory for handheld portable model number CLU1040BHLBA (PMUE3564D). This device is classified as Occupational/Controlled.

## 2.0 FCC SAR Summary

Table 1

| Equipment<br>Class | Frequency band (MHz) | Max Calc at<br>Body (W/kg) |  |
|--------------------|----------------------|----------------------------|--|
|                    |                      | 1g-SAR                     |  |
| TNT                | 450-470              | 2.46                       |  |

#### 3.0 Abbreviations / Definitions

CNR: Calibration Not Required

CW: Continuous Wave DUT: Device Under Test EME: Electromagnetic Energy

Li-Ion: Lithium-Ion

LMR: Land Mobile Radio

TNT: Licensed Non-Broadcast Transmitter Worn on Body

NA: Not Applicable PTT: Push to Talk RF: Radio Frequency

SAR: Specific Absorption Rate

Audio accessories: These accessories allow communication while the DUT is worn on the body.

Body worn accessories: These accessories allow the DUT to be worn on the body of the user.

Maximum Power: Defined as the upper limit of the production line final test station.

#### FCC ID: AZ489FT4945 / IC: 109U-89FT4945

#### 4.0 Referenced Standards and Guidelines

This product is designed to comply with the following applicable national and international standards and guidelines.

- IEC62209-1 (2005) Procedure to determine the specific absorption rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)
- Federal Communications Commission, "Evaluating Compliance with FCC Guidelines for Human Exposure to Radio frequency Electromagnetic Fields", OET Bulletin 65, FCC, Washington, D.C.: 1997.
- IEEE 1528 (2013), Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques
- American National Standards Institute (ANSI) / Institute of Electrical and Electronics Engineers (IEEE) C95. 1-1992
- Institute of Electrical and Electronics Engineers (IEEE) C95.1-2005
- International Commission on Non-Ionizing Radiation Protection (ICNIRP) 1998
- Ministry of Health (Canada) Safety Code 6 (2015), Limits of Human Exposure to Radio frequency Electromagnetic Fields in the Frequency Range from 3 kHz to 300 GHz
- RSS-102 (Issue 5) Radio Frequency (RF) Exposure Compliance of Radio communication Apparatus (All Frequency Bands)
- Australian Communications Authority Radio communications (Electromagnetic Radiation -Human Exposure) Standard (2014)
- ANATEL, Brazil Regulatory Authority, Resolution No. 303 of July 2, 2002 "Regulation of the limitation of exposure to electrical, magnetic, and electromagnetic fields in the radio frequency range between 9 kHz and 300 GHz." and "Attachment to resolution # 303 from July 2, 2002"
- IEC62209-2 Edition 1.0 2010-03, Human exposure to radio frequency fields from hand-held and body-mounted wireless communication devices Human models, instrumentation, and procedures Part 2: Procedure to determine the specific absorption rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz).
- FCC KDB 643646 D01 SAR Test for PTT Radios v01r03
- FCC KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz v01r04
- FCC KDB 865664 D02 RF Exposure Reporting v01r02
- FCC KDB 447498 D01 General RF Exposure Guidance v06

# 5.0 SAR Limits

FCC ID: AZ489FT4945 / IC: 109U-89FT4945

Table 2

|   | SAR (W/kg)                                     |  |  |  |
|---|--|--|--|--|
| EXPOSURE LIMITS                               | (General Population /<br>Uncontrolled Exposure | (Occupational /<br>Controlled Exposure |  |  |
| 0 114   | Environment)                                   | Environment)                           |  |  |
| Spatial Average - ANSI -                      |  |  |  |  |
| (averaged over the whole body)                | 0.08   | 0.4                                    |  |  |
| Spatial Peak - ANSI -                         |  |  |  |  |
| (averaged over any 1-g of tissue)             | 1.6  | 8.0                                    |  |  |

| (hands/wrists/feet/ankles averaged over 10-g) | 4.0  | 20.0                                   |  |  |
| Spatial Peak - ICNIRP -                       |  |  |  |  |
| (Head and Trunk 10-g)                         | 2.0  | 10.0                                   |  |  |

## **6.0** Description of Devices under Test (DUT)

This portable device operates in the LMR band using Frequency Modulation (FM).

The LMR band in this device operates in a half duplex system. A half duplex system only allows the user to transmit or receive. This device cannot transmit and receive simultaneously. The user must stop transmitting in order to receive a signal or listen for a response, regardless of PTT button or use of voice activated audio accessories. This type of operation, along with the RF safety booklet, which instructs the user to transmit no more than 50% of the time, justifies the use of 50% duty factor for this device.

Table 3 below summarizes the bands and maximum output powers. Maximum output powers are defined as upper limit of the production line final test station.

Table 3

| Technologies Band (MHz) Transmission |         | <b>Duty Cycle (%)</b> | Max Power (W) |     |
|--------------------------------------|---------|-----------------------|---------------|-----|
| LMR                                  | 450-470 | FM                    | *50           | 1.2 |

Note - \* includes 50% PTT operation

The intended operating position is "at the body" by means of the offered body worn accessories. Body worn audio and PTT operation is accomplished by means of optional remote accessories that are connected to the radio.

# 7.0 Optional Accessories and Test Criteria

FCC ID: AZ489FT4945 / IC: 109U-89FT4945

This device is offered with optional accessories. All accessories were individually evaluated during the test plan creation to determine if testing was required per the guidelines outlined in section 4.0 to assess compliance of this device. The following sections identify the test criteria and details for each accessory category.

#### 7.1 Antenna

There is only one internal antenna for this product. The table below lists its description.

Table 4

| Antenna  |   | Selected for |        |  |
|----------|---|--------------|--------|--|
| Model    | Description                                       | test         | Tested |  |
| Internal | UHF Helical antenna, 450-470MHz, ¼ wave, -2.0 dBi | Yes          | Yes    |  |

#### 7.2 Batteries

There are two batteries offered for this product. The Table below lists their descriptions.

Table 5

| <b>Battery Models</b> | Description                 | Selected<br>for test | Tested | Comments            |
|-----------------------|-----------------------------|----------------------|--------|---------------------|
| HKNN4013A             | BT90 1800mAh Li-Ion Battery | Yes                  | Yes    |                     |
|                       |                             |                      |        | Default battery for |
| HKNN4014B             | BT60 1130mAh Li-Ion Battery | Yes                  | Yes    | body                |

## 7.3 Body worn Accessories

There are optional body worn offered for this product. The Table below lists their descriptions.

Table 6

| Body worn<br>Models | Description              | Selected<br>for test | Tested | Comments                      |
|---------------------|--------------------------|----------------------|--------|-------------------------------|
| HKLN4438B           | Swivel Belt Clip holster | Yes                  | Yes    | Applicable for both batteries |
|                     |                          |                      |        | Only applicable for Slim      |
| HKLN4433A           | CLP Series magnetic case | Yes                  | Yes    | battery HKNN4014B             |

#### 7.4 Audio Accessories

All audio accessories were considered. The Table below lists the offered audio accessories and their descriptions. Exhibit 7B illustrates photos of the tested audio accessories.

Table 7

| Audio Acc. |  | Selected for |        |   |
|------------|--|--------------|--------|---|
| Models     | Description                                | test         | Tested | Comments  |
| HKLN4529A  | CLP single pin short cord earpiece         | Yes          | Yes    | Default Audio   |
| HKLN4602A  | CLP single pin non-adjustable PTT earpiece | Yes          | No     | Intended for test. Per KDB provisions test not required |
| HKLN4603A  | CLP single pin surveillance earpiece       | No           | No     | By similarity to HKLN4602A                              |
| HKLN4437A  | CLP single pin short cord earpiece         | No           | No     | By similarity to HKLN4529A                              |
| HKLN4455A  | CLP single pin non-adjustable PTT earpiece | No           | No     | By similarity to HKLN4602A                              |
| HKLN4487A  | CLP single pin surveillance earpiece       | No           | No     | By similarity to HKLN4602A                              |

## 8.0 Description of Test System

# 8.1 Descriptions of Robotics/Probes/Readout Electronics

Table 8

| System version | DAE type | <b>Probe Type</b>              |
|----------------|----------|--------------------------------|
| 52.8.8.1222    | DAE4     | ES3DV3/<br>EX3DV4<br>(E-Field) |
|                |          | V VX                           |

The DASY5<sup>TM</sup> system is operated per the instructions in the DASY5<sup>TM</sup> Users Manual. The complete manual is available directly from SPEAG<sup>TM</sup>. All measurement equipment used to assess SAR compliance was calibrated according to ISO/IEC 17025 SAMM guidelines. Section 9.0 presents additional test equipment

information. Appendices B and C present the applicable calibration certificates. The E-field probe first scans a coarse grid over a large area inside the phantom in order to locate the interpolated maximum SAR distribution. After the coarse scan measurement, the probe is automatically moved to a position at the interpolated maximum. The subsequent scan can directly use this position as reference for the cube evaluations.

## 8.2 Description of Phantom(s)

Table 9

| Phantom Type | Phantom(s) Used | Material<br>Parameters                                   | Phantom Dimensions LxWxD (mm) | Material<br>Thickness<br>(mm) | Support<br>Structure<br>Material | Loss<br>Tangent<br>(wood) |
|--------------|-----------------|--|-------------------------------|-------------------------------|----------------------------------|---------------------------|
| Triple Flat  | NA              | 200MHz -6GHz;<br>Er = 3-5,<br>Loss Tangent =<br>≤0.05    | 280x175x175                   |                               |                                  |                           |
| SAM          | NA              | 300MHz -6GHz;<br>Er = < 5,<br>Loss Tangent =<br>≤0.05    | Human Model                   | 2mm<br>+/- 0.2mm              | Wood                             | < 0.05                    |

#### **8.3** Description of Simulated Tissue

The sugar based simulate tissue is produced by placing the correct measured amount of De-ionized water into a large container. Each of the dried ingredients are weighed and added to the water carefully to avoid clumping. If the solution has a high sugar concentration the water is pre-heated to aid in dissolving the ingredients. For Diacetin and similar type simulates, sugar and HEC ingredients are not needed. The solution is mixed thoroughly, covered, and allowed to sit overnight prior to use.

The simulated tissue mixture was mixed based on the Simulated Tissue Composition indicated in Table 10. During the daily testing of this product, the applicable mixture was used to measure the Di-electric parameters at each of the tested frequencies to verify that the Di-electric parameters were within the tolerance of the tissue specifications.

# **Simulated Tissue Composition (percent by mass)**

Table 10

|                   | 450 MHz |
|-------------------|---------|
| Ingredients       | Body    |
| Sugar             | 46.50   |
| Diacetin          | 0       |
| De ionized –Water | 50.53   |
| Salt              | 1.87    |
| HEC               | 1.00    |
| Bact.             | 0.10    |

# 9.0 Additional Test Equipment

The Table below lists additional test equipment used during the SAR assessment.

Table 11

| Equipment Type                              | Model<br>Number | Serial Number | Calibration Date | Calibration Due<br>Date |
|---|-----------------|---------------|------------------|-------------------------|

# 10.0 SAR Measurement System Validation and Verification

DASY output files of the probe/dipole calibration certificates and system verification test results are included in appendices B, C & D respectively.

### **10.1** System Validation

FCC ID: AZ489FT4945 / IC: 109U-89FT4945

The SAR measurement system was validated according to procedures in KDB 865664. The validation status summary Table is below.

Table 12

| Dates      | Probe Ca<br>Poi |     | Probe<br>SN |      | red Tissue<br>ameters          | Validation     |           |          |  |

#### 10.2 System Verification

System verification checks were conducted each day during the SAR assessment. The results are normalized to 1W. Appendix D includes DASY plots for each day during the SAR assessment. The Table below summarizes the daily system check results used for the SAR assessment.

Table 13

| Probe<br>Serial | Tissue Type | Dipole Kit / Serial # | Ref SAR @ 1W<br>(W/kg) |      | System Check Test<br>Results when<br>normalized to 1W<br>(W/kg) | Tested<br>Date |

| 3196            | FCC Body    | SPEAG D450V3 /        | 4.52 +/- 10%           | 1.21 | 4.84  | 9/22/2017      |
| 3612            | FCC Body    | 1077                  | 4.32 +/- 10%           | 1.13 | 4.52  | 10/04/2017*    |

Note: \* System performance check cover next testing day (within 24 hours)

#### **10.3** Equivalent Tissue Test Results

Simulated tissue prepared for SAR measurements is measured daily and within 24 hours prior to actual SAR testing to verify that the tissue is within +/- 5% of target parameters at the center of the transmit band. This measurement is done using the applicable equipment indicated in section 9.0. The Table below summarizes the measured tissue parameters used for the SAR assessment.

Table 14

| Frequency (MHz) | Tissue Type | Conductivity<br>Target (S/m) | Dielectric<br>Constant<br>Target | Conductivity<br>Meas. (S/m) | Dielectric<br>Constant<br>Meas. | Tested Date |

Note: \* This tissue date covered for next test day (within 24 hours)

#### 11.0 Environmental Test Conditions

FCC ID: AZ489FT4945 / IC: 109U-89FT4945

The EME Laboratory's ambient environment is well controlled resulting in very stable simulated tissue temperature and therefore stable dielectric properties. Simulated tissue temperature is measured prior to each scan to insure it is within +/ - 2°C of the temperature at which the dielectric properties were determined. The liquid depth within the phantom used for measurements was at least 15cm. Additional precautions are routinely taken to ensure the stability of the simulated tissue such as covering the phantoms when scans are not actively in process in order to minimize evaporation. The lab environment is continuously monitored. The Table below presents the range and average environmental conditions during the SAR tests reported herein:

Table 15

|                     | Target     | Measured                             |
|---------------------|------------|--------------------------------------|
| Ambient Temperature | 18 – 25 °C | Range: 20.0 – 23.4°C<br>Avg. 21.4 °C |
| Tissue Temperature  | NA         | Range: 20.7 -21.3°C<br>Avg. 21.0°C   |

The EME Lab RF environment uses a Spectrum Analyzer to monitor for extraneous large signal RF contaminants that could possibly affect the test results. If such unwanted signals are discovered the SAR scans are repeated.

# 12.0 DUT Test Setup and Methodology

## 12.1 Measurements

SAR measurements were performed using the DASY system described in section 8.0 using zoom scans. Oval flat phantoms filled with applicable simulated tissue were used for body testing.

The Table below includes the step sizes and resolution of area and zoom scans per KDB 865664 requirements.

**Table 156** 

| Descr  | iption                           | ≤3 GHz  | > 3 GHz  |  |  |  |

Note:  $\delta$  is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details.

### 12.2 **DUT Configuration(s)**

The DUT is a portable device operational at the body as described in section 6.0 while using the applicable accessories listed in section 7.0. All accessories listed in section 7.0 of this report were considered.

#### **12.3 DUT Positioning Procedures**

The positioning of the device for each body location is described below and illustrated in Appendix G.

#### 12.3.1 Body

The DUT was positioned in normal use configuration against the phantom with the offered body worn accessory, battery, and audio accessories.

#### 12.3.2 Head

Not applicable.

#### 12.3.3 Face

Not applicable.

<sup>\*</sup> When zoom scan is required and the reported SAR from the area scan based 1-g SAR estimation procedures of KDB 447498 is  $\leq$  1.4 W/kg,  $\leq$  8 mm,  $\leq$  7 mm and  $\leq$  5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

#### **12.4 DUT Test Channels**

The number of test channels was determined by using the following IEEE 1528 equation. The use of this equation produces the same or more test channels compared to the FCC KDB 447498 number of test channels formula.

$$N_c = 2 * roundup[10 * (f_{high} - f_{low}) / f_c] + 1$$

Where

 $N_c$  = Number of channels

 $F_{high} = Upper channel$ 

 $F_{low} = Lower channel$ 

 $F_c$  = Center channel

#### 12.5 SAR Result Scaling Methodology

The calculated 1-gram averaged SAR results indicated as "Max Calc. 1g-SAR" in the data Tables is determined by scaling the measured SAR to account for power leveling variations and drift. Appendix F includes a shortened scan to justify SAR scaling for drift. For this device the "Max Calc. 1g-SAR" is scaled using the following formula:

$$Max\_Calc = SAR\_meas \cdot 10^{\frac{-Drift}{10}} \cdot \frac{P\_max}{P\_int} \cdot DC$$

 $P_{max} = Maximum Power (W)$ 

P int = Initial Power (W)

Drift = DASY drift results (dB)

SAR\_meas = Measured 1-g or 10-g Avg. SAR (W/kg)

DC = Transmission mode duty cycle in % where applicable

50% duty cycle is applied for PTT operation

Note: for conservative results, the following are applied:

If  $P_{int} > P_{max}$ , then  $P_{max}/P_{int} = 1$ .

Drift = 1 for positive drift

Additional SAR scaling was applied using the methodologies outlined in FCC KDB 865664 using tissue sensitivity values. SAR was scaled for conditions where the tissue permittivity was measured above the nominal target and for tissue conductivity that was measured below the nominal target. Negative or reduced SAR scaling is not permitted.

#### 12.6 DUT Test Plan

The guidelines and requirements outlined in section 4.0 were used to assess compliance of this device. All modes of operation identified in section 6.0 were considered during the development of the test plan. All tests were performed in CW and 50% duty cycle was applied to PTT configurations in the final results.

#### 13.0 DUT Test Data

#### 13.1 Assessments at the Body

Battery HKNN4014B was selected as default battery for assessment at the Body because it is the thinnest battery (refer to Exhibit 7b for battery illustration). The default battery was used during conducted power measurement for all test channels within FCC allocated frequency range (450-470 MHz) which are listed in Table 17. The channel with highest conducted power will be identified as default channel per KDB 643646 (SAR Test for PTT Radios).

Table 16

| Took Energ (MII-) | HKNN4014B |
|-------------------|-----------|
| Test Freq (MHz)   | Power (W) |
| 451.1875          | 1.11      |
| 461.0375          | 1.12      |
| 469.5625          | 1.08      |

# Assessments at the Body with Body worn HKLN4438B

Assessment of the Internal antenna with offered batteries, body worn and audio accessory were performed. Testing of additional channels was not required per KDB 447498. SAR plots of the highest results per Table 18 (bolded) are presented in Appendix E.

**Table 178**

# Assessments at the Body with Body worn HKLN4433A

Assessment of the Internal antenna with offered battery, body worn and audio accessory were performed. This body worn only compatible for battery HKNN4014B. Testing of additional channels was not required per KDB 447498. SAR plots of the highest results per Table 19 (bolded) are presented in Appendix E.

Table 19

### 13.2 Assessment for ISED, Canada

FCC ID: AZ489FT4945 / IC: 109U-89FT4945

Based on the assessment results for body per KDB643646, additional tests were not required for ISED Canada frequency range (450-470 MHz) as testing performed is in compliance with ISED Canada frequency range.

As per ISED Notice 2016-DRS001, additional tests were required for the low, mid and high frequency channels for the configuration with the highest SAR value. The SAR results are in Table 20 below. SAR plots of the highest results per Table (bolded) are presented in Appendix E.

Table 20

# 13.3 Shortened Scan Assessment

FCC ID: AZ489FT4945 / IC: 109U-89FT4945

A "shortened" scan using the highest SAR configuration overall from above was performed to validate the SAR drift of the full DASY5<sup>TM</sup> coarse and zoom scans. Note that the shortened scan represents the zoom scan performance result; this is obtained by first running a coarse scan to find the peak area and then, using a newly charged battery, a zoom scan only was performed. The results of the shortened cube scan presented in Appendix D demonstrate that the scaling methodology used to determine the calculated SAR results presented herein are valid. The SAR result from the Table below is provided in Appendix F.

Table 21

| Antenna  | Battery   | Carry Accessory | Cable<br>Accessory | Test<br>Freq<br>(MHz) | Pwr  | SAR<br>Drift<br>(dB) | 1g-<br>SAR | Max<br>Calc.<br>1g-<br>SAR<br>(W/kg) | Run#                    |

#### 14.0 Simultaneous Transmission Exclusion for BT

Not applicable.

### 15.0 Results Summary

Based on the test guidelines from section 4.0 and satisfying frequencies within FCC US band and ISED Canada Frequency band, the highest Operational Maximum Calculated 1-gram average SAR values found for this filing:

Table 22

| Designator   | Frequency band (MHz) | Max Calc at<br>Body (W/kg) |  |  |
|--------------|----------------------|----------------------------|--|--|
|              |                      | 1g-SAR                     |  |  |
| FCC, US      | 450-470              | 2.46                       |  |  |
| ISED, Canada | 450-470              | 2.46                       |  |  |

The test results clearly demonstrate compliance with FCC Occupational /Controlled RF Exposure limits of 8.0 W/kg averaged over 1 gram per the requirements of FCC 47 CFR § 2.1093.

FCC ID: AZ489FT4945 / IC: 109U-89FT4945 Report ID: P8400-EME-00001

## 16.0 Variability Assessment

Per the guidelines in KDB 865664 SAR variability assessment is not required because SAR results are below 4.0W/kg (Occupational).

## 17.0 System Uncertainty

A system uncertainty analysis is not required for this report per KDB 865664 because the highest report SAR value Occupational exposure is less than 7.5W/kg.

Per the guidelines of ISO/IEC 17025 a reported system uncertainty is required and therefore measurement uncertainty budget is included in Appendix A.

FCC ID: AZ489FT4945 / IC: 109U-89FT4945 Report ID: P8400-EME-00001

#### FCD-0558 Uncertainty Budget Rev.8

Notes for uncertainty budget Tables:

- a) Column headings a-k are given for reference.
- b) Tol. tolerance in influence quantity.
- c) Prob. Dist. Probability distribution
- d) N, R normal, rectangular probability distributions
- e) Div. divisor used to translate tolerance into normally distributed standard uncertainty
- f) *ci* sensitivity coefficient that should be applied to convert the variability of the uncertainty component into a variability of SAR.
- g) ui SAR uncertainty
- h) vi degrees of freedom for standard uncertainty and effective degrees of freedom for the expanded uncertainty

Table A.2: Uncertainty Budget for System Validation (dipole & flat phantom) for 450 MHz

- a) Column headings *a-k* are given for reference.
- b) Tol. tolerance in influence quantity.
- c) Prob. Dist. Probability distribution
- d) N, R normal, rectangular probability distributions
- e) Div. divisor used to translate tolerance into normally distributed standard uncertainty
- f) *ci* sensitivity coefficient that should be applied to convert the variability of the uncertainty component into a variability of SAR.
- g) ui SAR uncertainty
- h) vi degrees of freedom for standard uncertainty and effective degrees of freedom for the expanded uncertainty

#### CALIBRATION CERTIFICATE

Object

ES3DV3 - SN:3196

Calibration procedure(s)

QA CAL-01.v9, QA CAL-12.v9, QA CAL-23.v5, QA CAL-25.v6

Calibration procedure for dosimetric E-field probes

Calibration date:

May 17, 2017

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).

The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility; environment temperature (22 ± 3)°C and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS) The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

Glossary:

tissue simulating liquid NORMx,y,z sensitivity in free space sensitivity in TSL / NORMx,y,z ConvF DCP CF

diode compression point crest factor (1/duty\_cycle) of the RF signal A, B, C, D modulation dependent linearization parameters

Polarization φ o rotation around probe axis

Polarization 3 9 rotation around an axis that is in the plane normal to probe axis (at measurement center),

i.e., 3 = 0 is normal to probe axis

Connector Angle information used in DASY system to align probe sensor X to the robot coordinate system

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement
- b) IEC 62209-1, "Procedure to measure the Specific Absorption Rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)", February 2005
  c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices
- used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010 d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization 8 = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide). NORMx, y,z are only intermediate values, i.e., the uncertainties of NORMx,y,z does not affect the E²-field uncertainty inside TSL (see below CanvF).
- NORM(f)x,y,z = NORMx,y,z \* frequency\_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- Ax,y,z; Bx,y,z; Cx,y,z; Dx,y,z; VRx,y,z; A, B, C, D are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for  $f \le 800$  MHz) and inside waveguide using analytical field distributions based on power measurements for  $f \ge 800$  MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100
- Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMx (no uncertainty required).

## DASY/EASY - Parameters of Probe: ES3DV3 - SN:3196

**Basic Calibration Parameters** 

|  | Sensor X | Sensor Y | Sensor Z | Unc (k=2) |
|--|----------|----------|----------|-----------|
| Norm (µV/(V/m) <sup>2</sup> ) <sup>A</sup> | 1.25     | 1.26     | 1.30     | ± 10.1 %  |
| DCP (mV) <sup>B</sup>                      | 101.5    | 100.5    | 99.8     |           |

Modulation Calibration Parameters

| UID | Communication System Name |   | A<br>dB | B<br>dB√μV | С   | dB   | VR<br>mV | Unc <sup>2</sup><br>(k=2) |
|-----|---------------------------|---|---------|------------|-----|------|----------|---------------------------|
| 0   | CW                        | X | 0.0     | 0.0        | 1.0 | 0.00 | 191.9    | ±3.5 %                    |
|     |                           | Y | 0.0     | 0.0        | 1.0 |      | 203.8    |                           |
|     |                           | Z | 0.0     | 0.0        | 1.0 |      | 204.9    |                           |

Note: For details on UID parameters see Appendix.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

Certificate No: ES3-3196\_May17

Page 4 of 18

A The uncertainties of Norm X.Y.Z do not affect the E<sup>3</sup>-field uncertainty inside TSL (see Pages 5 and 6).

\*\*Numerical linearization parameter: uncertainty not required.

\*\*Uncertainty is determined using the max, deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

| 2100                 | 39.8                                  | 1.49                    | 5.44    | 5.44    | 5.44    | 0.78               | 1.22                       | ± 12.0 %     |
| 2300                 | 39.5                                  | 1.67                    | 5.00    | 5.00    | 5.00    | 0.74               | 1.27                       | ± 12.0 %     |
| 2450                 | 39.2                                  | 1.80                    | 4.74    | 4.74    | 4.74    | 0.65               | 1.38                       | ± 12.0 %     |
| 2600                 | 39.0                                  | 1.96                    | 4.60    | 4.60    | 4.60    | 0.75               | 1.25                       | ± 12.0 %     |

<sup>&</sup>lt;sup>6</sup> Frequency validity above 300 MHz of ± 100 MHz only applies for DASY v4.4 and higher (see Page 2), also it is restricted to ± 50 MHz. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity on be extended to ± 10 MHz.

\*At frequencies below 3 GHz, the validity of tissue parameters (a and o) can be relexed to ± 10% if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz, the validity of tissue parameters (a and o) is restricted to ± 5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.

\*Aphie/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz, and below ± 2% for frequencies between 3-6 GHz at any distance larger than half the probe tip disenseter from the boundary.

Frequency validity above 300 MHz of ± 100 MHz only applies for DASY v4.4 and higher (see Page 2), else it is restricted to ± 50 MHz. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for CorvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity can be extended to ± 100 MHz.

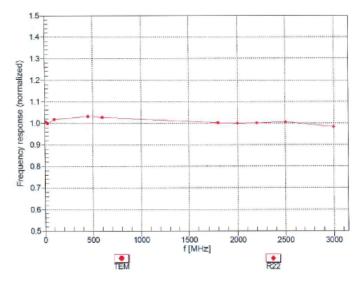

\*\*At frequencies below 3 GHz, the validity of tissue parameters (c and o) can be released to ± 10% if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz, the validity of tissue parameters (c and o) is restricted to ± 5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.

\*\*Apha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

Object EX3DV4 - SN:3612

Calibration procedure(s) QA CAL-01.v9, QA CAL-12.v9, QA CAL-14.v4, QA CAL-23.v5,

QA CAL-25.v6

Calibration procedure for dosimetric E-field probes

Calibration date: May 17, 2017

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).

The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature (22 ± 3)°C and humidity < 70%.

#### Glossary:

tissue simulating liquid NORMx,y,z ConvF DCP

sensitivity in free space sensitivity in TSL / NORMx,y,z diode compression point

crest factor (1/duty\_cycle) of the RF signal A, B, C, D modulation dependent linearization parameters

Polarization  $\phi$ φ rotation around probe axis

Polarization 9 9 rotation around an axis that is in the plane normal to probe axis (at measurement center),

i.e., 9 = 0 is normal to probe axis

Connector Angle information used in DASY system to align probe sensor X to the robot coordinate system

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- b) IEC 62209-1, "Procedure to measure the Specific Absorption Rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)", February 2005
   c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
   d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization 3 = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORMx,y,z does not affect the E<sup>z</sup>-field uncertainty inside TSL (see below *ConvF*).
- NORM(f)x,y,z = NORMx,y,z \* frequency\_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- Ax,y,z; Bx,y,z; Cx,y,z; Dx,y,z; VRx,y,z: A, B, C, D are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for f ≤ 800 MHz) and inside waveguide using analytical field distributions based on power measurements for f > 800 MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz.
- Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset. The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMx (no uncertainty required).

#### DASY/EASY - Parameters of Probe: EX3DV4 - SN:3612

#### **Basic Calibration Parameters**

|  | Sensor X | Sensor Y | Sensor Z | Unc (k=2) |
|--|----------|----------|----------|-----------|
| Norm (µV/(V/m) <sup>2</sup> ) <sup>A</sup> | 0.43     | 0.48     | 0.39     | ± 10.1 %  |
| DCP (mV) <sup>8</sup>                      | 94.2     | 96.8     | 97.5     |           |

**Modulation Calibration Parameters** 

| UID | Communication System Name |   | Α   | В     | С   | D    | VR    | Unc⁵   |
|-----|---------------------------|---|-----|-------|-----|------|-------|--------|
|     |                           |   | dB  | dB√μV |     | dB   | mV    | (k=2)  |
| 0   | CW                        | X | 0.0 | 0.0   | 1.0 | 0.00 | 140.4 | ±2.7 % |
|     |                           | Y | 0.0 | 0.0   | 1.0 | 1    | 140.7 |        |
|     |                           | Z | 0.0 | 0.0   | 1.0 |      | 141.7 |        |

Note: For details on UID parameters see Appendix.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

Certificate No: EX3-3612\_May17

Page 4 of 15

<sup>&</sup>lt;sup>^</sup> The uncertainties of Norm X,Y,Z do not affect the E<sup>2</sup>-field uncertainty inside TSL (see Pages 5 and 6).

<sup>a</sup> Numerical linearization parameter: uncertainty not required.

<sup>a</sup> Uncertainty is determined using the max. deviation from linear response spplying rectangular distribution and is expressed for the square of the field value.

| 5600                 | 35.5                                  | 5.07                               | 4.36    | 4.36    | 4.36    | 0.40               | 1.80                       | ± 13.1 %     |
| 5750                 | 35.4                                  | 5.22                               | 4.85    | 4.85    | 4.85    | 0.40               | 1.80                       | ± 13.1 %     |

<sup>&</sup>lt;sup>O</sup> Frequency validity above 300 MHz of ± 100 MHz only applies for DASY v4.4 and higher (see Page 2), else it is restricted to ± 50 MHz. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity can be extended to ± 110 MHz.

\*At frequencies below 3 GHz, the validity of tissue parameters (s and σ) can be relaxed to ± 10% if liquid compensation formula is applied to measured 52N values. At frequencies above 3 GHz, the validity of tissue parameters (c and σ) is restricted to ± 5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.

\*ApharDepth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

Calibration Laboratory of Schmid & Partner Engineering AG Zeughausstrasse 43, 8004 Zurich, Switzerland

S Schweizerischer Kalibrierdienst
C Service suisse d'étalonnage
Servizio svizzero di taratura
S Swiss Calibration Service

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS)
The Swiss Accreditation Service is one of the signatories to the EA
Multilateral Agreement for the recognition of calibration certificates

#### Glossary:

TSL tissue simulating liquid
ConvF sensitivity in TSL / NORM x,y,z
N/A not applicable or not measured

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- EC 62209-1, "Procedure to measure the Specific Absorption Rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)", February 2005
- c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### **Additional Documentation:**

e) DASY4/5 System Handbook

#### Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end
  of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed
  point exactly below the center marking of the flat phantom section, with the arms oriented
  parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole
  positioned under the liquid filled phantom. The impedance stated is transformed from the
  measurement at the SMA connector to the feed point. The Return Loss ensures low
  reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point.
   No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

Certificate No: D450V3-1077\_Nov15

#### **Measurement Conditions**

DASY system configuration, as far as not given on page 1.

| DASY Version                 | DASY5                  | V52.8.8                     |
|------------------------------|------------------------|-----------------------------|
| Extrapolation                | Advanced Extrapolation |                             |
| Phantom                      | ELI4 Flat Phantom      | Shell thickness: 2 ± 0.2 mm |
| Distance Dipole Center - TSL | 15 mm                  | with Spacer                 |
| Zoom Scan Resolution         | dx, dy, dz = 5 mm      |                             |
| Frequency                    | 450 MHz ± 1 MHz        |                             |

#### Head TSL parameters

The following parameters and calculations were applied.

|   | Temperature     | Permittivity | Conductivity     |
|---|-----------------|--------------|------------------|
| Nominal Head TSL parameters             | 22.0 °C         | 43.5         | 0.87 mho/m       |
| Measured Head TSL parameters            | (22.0 ± 0.2) °C | 44.0 ± 6 %   | 0.89 mho/m ± 6 % |
| Head TSL temperature change during test | < 0.5 °C        |              |                  |

#### SAR result with Head TSL

| SAR averaged over 1 cm <sup>3</sup> (1 g) of Head TSL | Condition          |                          |
|---|--------------------|--------------------------|
| SAR measured  | 250 mW input power | 1.16 W/kg                |
| SAR for nominal Head TSL parameters                   | normalized to 1W   | 4.57 W/kg ± 18.1 % (k=2) |

| SAR averaged over 10 cm <sup>3</sup> (10 g) of Head TSL | condition          |                          |
|---|--------------------|--------------------------|
| SAR measured  | 250 mW input power | 0.777 W/kg               |
| SAR for nominal Head TSL parameters                     | normalized to 1W   | 3.07 W/kg ± 17.6 % (k=2) |

#### **Body TSL parameters**

The following parameters and calculations were applied.

|   | Temperature     | Permittivity | Conductivity     |
|---|-----------------|--------------|------------------|
| Nominal Body TSL parameters             | 22.0 °C         | 56.7         | 0.94 mho/m       |
| Measured Body TSL parameters            | (22.0 ± 0.2) °C | 56.3 ± 6 %   | 0.95 mho/m ± 6 % |
| Body TSL temperature change during test | < 0.5 °C        |              |                  |

#### SAR result with Body TSL

| SAR averaged over 1 cm <sup>3</sup> (1 g) of Body TSL | Condition          |                          |
|---|--------------------|--------------------------|
| SAR measured  | 250 mW input power | 1.14 W/kg                |
| SAR for nominal Body TSL parameters                   | normalized to 1W   | 4.52 W/kg ± 18.1 % (k=2) |

| SAR averaged over 10 cm <sup>3</sup> (10 g) of Body TSL | condition          |                          |
|---|--------------------|--------------------------|
| SAR measured  | 250 mW input power | 0.749 W/kg               |
| SAR for nominal Body TSL parameters                     | normalized to 1W   | 2.97 W/kg ± 17.6 % (k=2) |

Certificate No: D450V3-1077\_Nov15

# Appendix (Additional assessments outside the scope of SCS 0108)

#### Antenna Parameters with Head TSL

| Impedance, transformed to feed point | 58.1 Ω - 2.3 jΩ |  |  |
|--------------------------------------|-----------------|--|--|
| Return Loss                          | - 22.1 dB       |  |  |

#### Antenna Parameters with Body TSL

| Impedance, transformed to feed point | 55.0 Ω - 6.8 jΩ |  |  |
|--------------------------------------|-----------------|--|--|
| Return Loss                          | - 21.9 dB       |  |  |

#### General Antenna Parameters and Design

| Electrical Delay (one direction) | 1.349 ns |
|----------------------------------|----------|
|----------------------------------|----------|

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

#### Additional EUT Data

| Manufactured by | SPEAG         |  |  |

#### DASY5 Validation Report for Head TSL

Date: 25.11.2015

Test Laboratory: SPEAG, Zurich, Switzerland

# DUT: Dipole 450 MHz; Type: D450V3; Serial: D450V3 - SN: 1077

Communication System: UID 0 - CW; Frequency: 450 MHz

Medium parameters used: f = 450 MHz;  $\sigma = 0.89$  S/m;  $\varepsilon_r = 44$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Phantom section: Flat Section

Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2011)

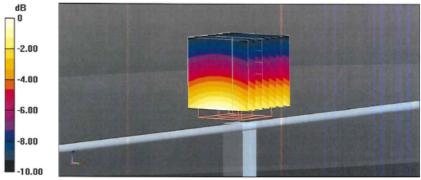

#### DASY52 Configuration:

- Probe: ET3DV6 SN1507; ConvF(6.58, 6.58, 6.58); Calibrated: 30.12.2014;
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn654; Calibrated: 08.07.2015
- Phantom: ELI v4.0; Type: QDOVA001BB; Serial: TP:1003
- DASY52 52.8.8(1222); SEMCAD X 14.6.10(7331)

#### Dipole Calibration for Head Tissue/d=15mm, Pin=250mW/Zoom Scan (7x7x7)/Cube 0:

Measurement grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 39.43 V/m; Power Drift = -0.04 dB Peak SAR (extrapolated) = 1.67 W/kg

SAR(1 g) = 1.16 W/kg; SAR(10 g) = 0.777 W/kgMaximum value of SAR (measured) = 1.25 W/kg

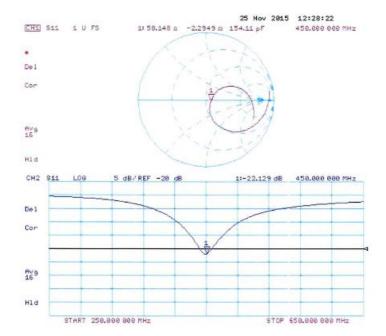

0 dB = 1.25 W/kg = 0.97 dBW/kg

Certificate No: D450V3-1077\_Nov15

#### **DASY5 Validation Report for Body TSL**

Date: 25.11.2015

Test Laboratory: SPEAG, Zurich, Switzerland

#### DUT: Dipole 450 MHz; Type: D450V3; Serial: D450V3 - SN: 1077

Communication System: UID 0 - CW; Frequency: 450 MHz

Medium parameters used: f = 450 MHz;  $\sigma = 0.95 \text{ S/m}$ ;  $\varepsilon_r = 56.3$ ;  $\rho = 1000 \text{ kg/m}^3$ 

Phantom section: Flat Section

Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2011)

#### DASY52 Configuration:

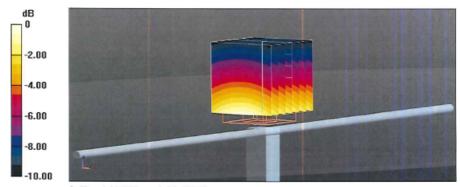

- Probe: ET3DV6 SN1507; ConvF(7.05, 7.05, 7.05); Calibrated: 30.12.2014;
- Sensor-Surface: 4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn654; Calibrated: 08.07.2015
- Phantom: ELI v4.0; Type: QDOVA001BB; Serial: TP:1003
- DASY52 52.8.8(1222); SEMCAD X 14.6.10(7331)

#### Dipole Calibration for Body Tissue/d=15mm, Pin=250mW/Zoom Scan (7x7x7)/Cube 0:

Measurement grid: dx=5mm, dy=5mm, dz=5mm Reference Value = 36.74 V/m; Power Drift = -0.04 dB Peak SAR (extrapolated) = 1.80 W/kg

SAR(1 g) = 1.14 W/kg; SAR(10 g) = 0.749 W/kg

Maximum value of SAR (measured) = 1.22 W/kg

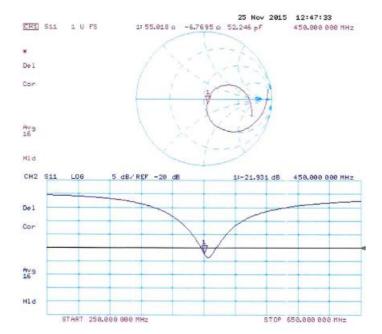

0 dB = 1.22 W/kg = 0.86 dBW/kg

# **Dipole Data**

As stated in KDB 865664, for dipole D450V3 (serial number 1077) exceed annual calibration, the test laboratory must ensure that the required supporting information and documentation are included in report to qualify for extended calibration interval.

The table below includes dipole impedance and return loss measurement data measured by Motorola Solutions' EME lab. The results meet requirements stated in KDB 865664.

| Dipole D450V3 Head |           |            | Body               |           |            |                    |
|--------------------|-----------|------------|--------------------|-----------|------------|--------------------|
| (SN 1077)          | Imp       | edance     | <b>Return Loss</b> | Impedance |            | <b>Return Loss</b> |
| Date Measured      | real<br>Ω | imag<br>jΩ | dB                 | real<br>Ω | imag<br>jΩ | dB                 |
| 12/01/2016         | 59.08     | -2.93      | -22.65             | 51.05     | -7.45      | -22.63             |
