

#### DECLARATION OF COMPLIANCE SAR ASSESSMENT PCII Report Part 1 of 2

# **Motorola Solutions Inc**

**EME Test Laboratory** 

Motorola Solutions Malaysia Sdn Bhd (Innoplex) (455657-H) Plot 2A, Medan Bayan Lepas, Mukim 12 SWD, 11900 Bayan Lepas Penang, Malaysia.

Date of Report: 12/03/2018

**Report Revision:** 

**Responsible Engineer:** Saw Sun Hock (EME Engineer) **Report Author:** Saw Sun Hock (EME Engineer) Date/s Tested: 11/2/2018, 11/7/2018, 11/9/2018

Manufacturer: Motorola Solutions Inc.

**DUT Description:** Video RSM Si500 (Fusion), display, BT, 5GHz WiFi

**Test TX mode(s):** WLAN 802.11b/g/n (2.4 GHz), WLAN 802.11 ac/n (5 GHz), Bluetooth,

Bluetooth LE

Max. Power output: Refer to Part 1. Table 3 **Nominal Power:** Refer to Part 1. Table 3

**Tx Frequency Bands:** WLAN 2.4 GHz 802.11 b/g/n, WLAN 5 GHz 802.11 ac/n, Bluetooth,

Bluetooth LE

DSSS, OFDM & FHSS (Bluetooth) Signaling type:

Model(s) Tested: N7001A Model(s) Certified: N7001A **Serial Number(s):** 372TTX0098

**Classification:** Occupational / Controlled (comply with General Population / Uncontrolled limit) FCC ID: AZ489FT7105; WLAN 2.4 GHz 802.11 b/g/n, WLAN 5 GHz 802.11 ac/n,

Bluetooth, Bluetooth LE.

This report contains results that are immaterial for FCC equipment approval,

which are clearly identified.

109U-89FT7105; This report contains results that are immaterial for IC IC

equipment approval, which are clearly identified

**ISED Test Site Registration:** 109AK

**FCC Test Firm Registration** 

Number: 823256

The test results clearly demonstrate compliance with FCC General Population/Uncontrolled RF Exposure limits of 1.6 W/kg averaged over 1 gram per the requirements of FCC 47 CFR § 2.1093 and ISED RSS-102 (Issue 5).

Based on the information and the testing results provided herein, the undersigned certifies that when used as stated in the operating instructions supplied, said product complies with the national and international reference standards and guidelines listed in section 4.0 of this report. This report shall not be reproduced without written approval from an officially designated representative of the Motorola Solutions Inc EME Laboratory. I attest to the accuracy of the data and assume full responsibility for the completeness of these measurements. This reporting format is consistent with the suggested guidelines of the TIA TSB-150 December 2004. The results and statements contained in this report pertain only to the device(s) evaluated.

Tiong

**Tiong Nguk Ing Deputy Technical Manager (Approved Signatory)**

#### 1.0 Introduction

This report details the utilization, test setup, test equipment, and test results of the Specific Absorption Rate (SAR) measurements performed at the Motorola Solutions Inc. EME Test Laboratory for model number N7001A. This device is classified as Occupational/Controlled but comply with General Population/Uncontrolled SAR limit as operate in unlicensed frequency bands. The information herein is to show evidence of Class II Permissive Change compliance base on the SAR evaluation of new body worn PMLN7960A introduce to this device.

# 2.0 FCC SAR Summary

Table 1

Equipment Class	Frequency band (MHz)	Max Calc at Body (W/kg)
DTS	2.4GHz WLAN (WLAN 802.11b/g/n)	0.37
NII	5GHz WLAN (WLAN 802.11 ac/n)	0.42

#### Note:

New highest reported SAR value for body-worn accessory exposure conditions are 0.37 W/kg (2.4GHz) and 0.42 W/kg (5GHz).

#### 3.0 Abbreviations / Definitions

BT: Bluetooth

CNR: Calibration Not Required

CW: Continuous Wave

**DSS: Direct Spread Spectrum** 

**DSSS:** Direct Sequence Spread Spectrum

**DTS:** Digital Transmission System

**DUT: Device Under Test** 

EME: Electromagnetic Energy

FHSS: Frequency Hopping Spread Spectrum

RF: Radio Frequency NA: Not Applicable

NII: National Information Infrastructure

OFDM: Orthogonal Frequency Division Multiplexing

SAR: Specific Absorption Rate

U-NII: Unlicensed National Information Infrastructure

WLAN: Wireless Local Area Network

Audio accessories: These accessories allow communication while the DUT is worn on the body.

Body worn accessories: These accessories allow the DUT to be worn on the body of the user.

Maximum Power: Defined as the upper limit of the production line final test station.

#### 4.0 Referenced Standards and Guidelines

This product is designed to comply with the following applicable national and international standards and guidelines.

- IEC62209-1 (2005) Procedure to determine the specific absorption rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)
- Federal Communications Commission, "Evaluating Compliance with FCC Guidelines for Human Exposure to Radio frequency Electromagnetic Fields", OET Bulletin 65, FCC, Washington, D.C.: 1997.
- IEEE 1528 (2013), Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques
- American National Standards Institute (ANSI) / Institute of Electrical and Electronics Engineers (IEEE) C95. 1-1992
- Institute of Electrical and Electronics Engineers (IEEE) C95.1-2005
- International Commission on Non-Ionizing Radiation Protection (ICNIRP) 1998
- Ministry of Health (Canada) Safety Code 6 (2015), Limits of Human Exposure to Radio frequency Electromagnetic Fields in the Frequency Range from 3 kHz to 300 GHz
- RSS-102 (Issue 5) Radio Frequency (RF) Exposure Compliance of Radio communication Apparatus (All Frequency Bands)
- Australian Communications Authority Radio communications (Electromagnetic Radiation -Human Exposure) Standard (2014)
- ANATEL, Brazil Regulatory Authority, Resolution No. 303 of July 2, 2002 "Regulation of the limitation of exposure to electrical, magnetic, and electromagnetic fields in the radio frequency range between 9 kHz and 300 GHz." and "Attachment to resolution # 303 from July 2, 2002"
- IEC62209-2 Edition 1.0 2010-03, Human exposure to radio frequency fields from hand-held and body-mounted wireless communication devices Human models, instrumentation, and procedures Part 2: Procedure to determine the specific absorption rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz).

#### 5.0 SAR Limits

Table 1

	SAR (W/kg)				
EXPOSURE LIMITS	(General Population / Uncontrolled Exposure	(Occupational / Controlled Exposure			
	<b>Environment</b> )	<b>Environment</b> )			
Spatial Average - ANSI -					
(averaged over the whole body)	0.08	0.4			
Spatial Peak - ANSI -					
(averaged over any 1-g of tissue)	1.6	8.0			
Spatial Peak – ICNIRP/ANSI -					
(hands/wrists/feet/ankles averaged over 10-g)	4.0	20.0			
Spatial Peak - ICNIRP -					
(Head and Trunk 10-g)	2.0	10.0			

# 6.0 Description of Devices under Test (DUT)

This device operates in the WLAN technology for data capabilities over 802.11 b/g/n (2.4GHz), 802.11ac/n (5GHz) wireless network and Bluetooth technology for short range wireless device.

This device also incorporates a Bluetooth v4.0, which include classis Bluetooth, and Bluetooth low energy. It is Class 1 Bluetooth device with Frequency Hopping Spread Spectrum (FHSS) technology. The Bluetooth radio modem is used to wireless link audio accessories. The maximum actual transmission duty cycle is imposed by the Bluetooth standard. The maximum duty cycle for BT is derived from 5-slots packet type operation which consists of receiving on 1-slot and transmitting on 5-slots, and thus maximum duty cycle=78%

WLAN 2.4GHz 802.11 b/g/n operate using Direct Sequence Spread Spectrum (DSSS) and Orthogonal Frequency-Division Multiplexing (OFDM) with channel bandwidth of 20 MHz WLAN 5GHz 802.11 ac/n operate using Orthogonal Frequency-Division Multiplexing (OFDM) with channel bandwidth of 20MHz, 40MHz, 80MHz.

Table 3 below summarizes the bands and maximum output powers. Maximum output powers are defined as upper limit of the production line final test station.

Table 3

Technologies	Band (MHz)	Transmission	Duty Cycle (%)	Nominal Power (mW)	Max Power (mW)
2.4 GHz WLAN-802.11b	2412-2462	DSSS	99.97%	63	79.4
2.4 GHz WLAN-802.11g	2412-2462	OFDM	99.82%	47.9	60.3
2.4 GHz WLAN-802.11n (20 MHz)	2412-2462	OFDM	99.80%	38.0	47.9
2.4 GHz WLAN-802.11n (40 MHz)	2412-2462	OFDM	99.60%	38.9	49.0
5 GHz WLAN-802.11n (20 MHz)	5150-5850	OFDM	99.80%	32.4	40.7
5 GHz WLAN-802.11n (40 MHz)	5150-5850	OFDM	99.60%	35.5	44.7
5 GHz WLAN-802.11ac (20 MHz)	5150-5850	OFDM	98.99%	34.7	43.7
5 GHz WLAN-802.11ac (40 MHz)	5150-5850	OFDM	98.00%	37.2	46.8
5 GHz WLAN-802.11ac (80 MHz)	5150-5850	OFDM	96.15%	35.5	44.7
Bluetooth Bluetooth LE	2402-2480 2402-2480	FHSS DSSS	78% 50%	10.0 10.0	11.2 11.2

The intended operating position is "at the body" with the DUT facing front against the phantom. The positions "at the body" by mean of the offered body worn accessories.

# 7.0 Optional Accessories and Test Criteria

The following sections describe the antennas, batteries, and body-worn accessories.

## 7.1 Antennas

Only one antenna applicable for this PCII filling. The Table below lists the antenna and it description.

Table 4

Antenna Models	Description	Selected for test	Tested
	Internal WLAN antenna, 2400-2484MHz, 5150-5850 MHz, $\lambda$ 2 wave, Low -2.56 dBd, Mid -0.59 dBd, High 0.7 dBd		
AN000183A05	Internal BT antenna, 2400-2484 MHz, $\lambda/4$ wave, Low -2.57 dBd, Mid -2.41 dBd, High -2.02 dBd	Yes	Yes

## 7.2 Batteries

Only one battery applicable for this PCII filling. The Table below lists it description.

Table 5

Battery Models Description		Selected for test	Tested	Comments
PMNN4549A	High Capacity IMPRES Battery 2925 mAh	Yes	Yes	

# 7.3 Body worn Accessories

New body worn introduced for this PCII filling. The Table below lists it description.

Table 6

Body worn Models	Description	Selected for test	Tested	Comments
PMLN7960A	Mounting Kit, SI Magnetic Mount Carry Holster	Yes	Yes	

# 7.4 Audio Accessory

There is no audio accessory applicable for this PCII filling.

## 8.0 Description of Test System

#### 8.1 Descriptions of Robotics/Probes/Readout Electronics

Table 7

<b>Dosimetric System type</b>	System version	DAE type	<b>Probe Type</b>
Schmid & Partner Engineering AG SPEAG DASY 5	52.8.8.1222	DAE4	EX3DV4 (E-Field)

The DASY5<sup>TM</sup> system is operated per the instructions in the DASY5<sup>TM</sup> Users Manual. The complete manual is available directly from SPEAG<sup>TM</sup>. All measurement equipment used to assess SAR compliance was calibrated according to ISO/IEC 17025 A2LA guidelines. Section 9.0 presents additional test equipment information. Appendices B and C present the applicable calibration certificates. The E-field probe first scans a coarse grid over a large area inside the phantom in order to locate the interpolated maximum SAR distribution. After the coarse scan measurement, the probe is automatically moved to a position at the interpolated maximum. The subsequent scan can directly use this position as reference for the cube evaluations.

## 8.2 Description of Phantom(s)

Table 8

Phantom Type	Phantom(s) Used	Material Parameters	Phantom Dimensions LxWxD (mm)	Material Thickness (mm)	Support Structure Material	Loss Tangent (wood)
Triple Flat	√	200MHz -6GHz; Er = 3-5, Loss Tangent = ≤0.05	280x175x175	()		
SAM	NA	300MHz -6GHz; Er = < 5, Loss Tangent = ≤0.05	Human Model	2mm +/- 0.2mm	Wood	< 0.05
Oval Flat	NA	300MHz -6GHz; Er = 4+/- 1, Loss Tangent = ≤0.05	600x400x190			

# **8.3** Description of Simulated Tissue

The sugar based simulate tissue is produced by placing the correct measured amount of De-ionized water into a large container. Each of the dried ingredients are weighed and added to the water carefully to avoid clumping. If the solution has a high sugar concentration the water is pre-heated to aid in dissolving the ingredients. For Diacetin and similar type simulates, sugar and HEC ingredients are not needed. The solution is mixed thoroughly, covered, and allowed to sit overnight prior to use.

The simulated tissue mixture was mixed based on the Simulated Tissue Composition indicated in Table 9. During the daily testing of this product, the applicable mixture was used to measure the Di-electric parameters at each of the tested frequencies to verify that the Di-electric parameters were within the tolerance of the tissue specifications.

Simulated Tissue Composition (percent by mass)
Table 9

	2450 MHz	*5 GHz
Ingredients	Body	Body
Sugar	NA	NA
Diacetin	34.5	NA
De ionized –		
Water	65.20	NA
Salt	0.20	NA
HEC	NA	NA
Bact.	0.1	NA

Note: \* SPEAG provides Motorola proprietary stimulant ingredients for the 5 GHz band

# 9.0 Additional Test Equipment

The Table below lists additional test equipment used during the SAR assessment.

Table 10

Equipment Type	Model Number	Serial Number	Calibration Date	Calibration Due Date
Speag Probe	EX3DV4	7486	3/20/2018	3/20/2019
Speag DAE	DAE4	1488	3/9/2018	3/9/2019

# 10.0 SAR Measurement System Validation and Verification

DASY output files of the probe/dipole calibration certificates and system verification test results are included in appendices B, C & D respectively.

# 10.1 System Validation

The SAR measurement system was validated according to procedures in KDB 865664. The validation status summary Table is below.

Table 11

Dates	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$					Validation					
			Sensitivity	Linearity	Isotropy						
CW											
4/24/2018	Body	2450		2.01	47.9	Pass	Pass	Pass			
4/22/2018	Head	2450	7106	1.82	36.3	Pass	Pass	Pass			
4/24/2018	Body	5750	7486	6.05	44.0	Pass	Pass	Pass			
4/22/2018	Head	5750		4.89	31.9	Pass	Pass	Pass			

# **10.2** System Verification

System verification checks were conducted each day during the SAR assessment. The results are normalized to 1W. Appendix D includes DASY plots for each day during the SAR assessment. The Table below summarizes the daily system check results used for the SAR assessment.

Table 12

Probe Serial #	Tissue Type	Dipole Kit / Serial #	Ref SAR @ 1W (W/kg)	System Check Results Measured (W/kg)	System Check Test Results when normalized to 1W (W/kg)	Tested Date
		SPEAG D2450V2 /	50.50 +/- 10%	13.2	52.80	11/2/2018
		782	30.30 +/- 10/0	12.9	51.60	11/7/2018
7486	7486 FCC Body	SPEAG D5GHzV2		7.20	72.00	11/2/2018
		/ 1022	76.70 +/- 10%	7.40	74.00	11/9/2018

# **10.3** Equivalent Tissue Test Results

Simulated tissue prepared for SAR measurements is measured daily and within 24 hours prior to actual SAR testing to verify that the tissue is within +/- 5% of target parameters at the center of the transmit band. This measurement is done using the applicable equipment indicated in section 9.0. The Table below summarizes the measured tissue parameters used for the SAR assessment.

Table 13

Frequency (MHz)	Tissue Type	Conductivity Target (S/m)	Dielectric Constant Target	Conductivity Meas. (S/m)	Dielectric Constant Meas.	Tested Date
2412		1.91 (1.82-2.01)	52.8 (47.5-58.0)	1.91	48.1	11/2/2018
2437		1.94 52.7 (1.84-2.03) (47.4-58.0)		1.95	47.8	11/7/2018

5710		5.89 (5.31-6.48)	48.3 (43.5-53.2)	5.84	44.3	11/2/2018
5670		5.85 (5.26-6.43)	48.4 (43.5-53.2)	5.99	44.2	11/9/2018
5750	FCC Body	5.94	48.3	5.90	44.3	11/2/2018
5750		(5.35-6.54)	(43.4-53.1)	6.09	44.1	11/9/2018
5795		5.99 (5.39-6.59)	48.2 (43.4-53.0)	6.15	44.0	11/9/2018

#### 11.0 Environmental Test Conditions

The EME Laboratory's ambient environment is well controlled resulting in very stable simulated tissue temperature and therefore stable dielectric properties. Simulated tissue temperature is measured prior to each scan to insure it is within  $\pm$ 0°C of the temperature at which the dielectric properties were determined. The liquid depth within the phantom used for measurements was at least 15cm. Additional precautions are routinely taken to ensure the stability of the simulated tissue such as covering the phantoms when scans are not actively in process in order to minimize evaporation. The lab environment is continuously monitored. The Table below presents the range and average environmental conditions during the SAR tests reported herein:

Table 14

	Target	Measured
	18 – 25 °C	Range: 19.8 – 23.5°C
Ambient Temperature	18 – 23 C	Avg. 21.4 °C
	18 – 25 °C	Range: 20.8 -22.3°C
Tissue Temperature	18 – 23 C	Avg. 21.4°C

The EME Lab RF environment uses a Spectrum Analyzer to monitor for extraneous large signal RF contaminants that could possibly affect the test results. If such unwanted signals are discovered the SAR scans are repeated.

#### 12.0 DUT Test Setup and Methodology

#### 12.1 Measurements

SAR measurements were performed using the DASY system described in section 8.0 using zoom scans. Triple flat phantoms filled with applicable simulated tissue were used for body testing.

The Table below includes the step sizes and resolution of area and zoom scans per KDB 865664 requirements.

Table 15

Description	≤3 GHz	> 3 GHz				
Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface	5 ± 1 mm	$\frac{1}{2} \cdot \delta \cdot \ln(2) \pm 0.5 \text{ mm}$				
Maximum probe angle from probe axis to phantom surface normal at the measurement location	30° ± 1°	20° ± 1°				
	≤ 2 GHz: ≤ 15 mm	3 – 4 GHz: ≤ 12 mm				
	2 - 3 GHz: ≤ 12 mm	$4-6$ GHz: $\leq 10$ mm				
	When the x or y dimensi	on of the test device, in				
Maximum area scan spatial resolution: ΔxArea, ΔyArea	the measurement plane o	the measurement plane orientation, is smaller				
wiaximum area sean spatial resolution. Axarea, Ayarea	than the above, the meas	than the above, the measurement resolution must				
	be $\leq$ the corresponding x	•				
	test device with at least of	one measurement point				
	on the test device.					
Maximum zoom scan spatial resolution: ΔxZoom, ΔyZoom	$\leq$ 2 GHz: $\leq$ 8 mm	$3 - 4 \text{ GHz: } \leq 5 \text{ mm*}$				
	$2-3 \text{ GHz: } \leq 5 \text{ mm*}$	$4-6 \text{ GHz: } \leq 4 \text{ mm*}$				
Maximum zoom scan spatial uniform grid: ΔzZoom(n)		$3 - 4$ GHz: $\leq 4$ mm				
resolution, normal to	≤ 5 mm	$4-5$ GHz: $\leq 3$ mm				
phantom surface		$5-6$ GHz: $\leq 2$ mm				

Note:  $\delta$  is the penetration depth of a plane-wave at normal incidence to the tissue medium; see draft standard IEEE P1528-2011 for details.

## **12.2 DUT** Configuration(s)

The DUT is a device operational at the body as described in section 6.0 while using the applicable accessories listed in section 7.0. All accessories listed in section 7.0 of this report were considered when implementing the standards and guidelines specified in section 4.0.

# **12.3 DUT Positioning Procedures**

The positioning of the device for each body location is described below and illustrated in Appendix F.

<sup>\*</sup> When zoom scan is required and the reported SAR from the area scan based 1-g SAR estimation procedures of KDB 447498 is  $\leq 1.4$  W/kg,  $\leq 8$  mm,  $\leq 7$  mm and  $\leq 5$  mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

# 12.3.1 Body

The DUT was positioned in normal use configuration with its front against the phantom with the offered body worn accessories.

#### 12.3.2 Head

Not applicable.

#### 12.3.3 Face

Not applicable.

#### 12.4 DUT Test Channels

The number of test channels was determined by using the following IEEE 1528 equation. The use of this equation produces the same or more test channels compared to the FCC KDB 447498 number of test channels formula.

$$N_c = 2 * roundup[10 * (f_{high} - f_{low}) / f_c] + 1$$

Where

 $N_c$  = Number of channels

 $F_{high} = Upper channel$ 

 $F_{low} = Lower channel$ 

 $F_c$  = Center channel

## 12.5 SAR Result Scaling Methodology

The calculated 1-gram averaged SAR results indicated as "Max Calc. 1g-SAR" in the data Tables is determined by scaling the measured SAR to account for power leveling variations and drift. Appendix E includes a shortened scan to justify SAR scaling for drift. For this device the "Max Calc. 1g-SAR" is scaled using the following formula:

$$Max\_Calc = SAR\_meas \cdot 10^{\frac{-Drift}{10}} \cdot \frac{P\_max}{P\_int} \cdot DC$$

 $P_{max} = Maximum Power (W)$ 

 $P_{int} = Initial Power(W)$ 

Drift = DASY drift results (dB)

SAR\_meas = Measured 1-g or 10-g Avg. SAR (W/kg)

DC = Transmission mode duty cycle in % where applicable

50% duty cycle is applied for PTT operation

Note: for conservative results, the following are applied:

If  $P_{int} > P_{max}$ , then  $P_{max}/P_{int} = 1$ .

Drift = 1 for positive drift

Report ID: P14676-EME-00001

Additional SAR scaling was applied using the methodologies outlined in FCC KDB 865664 using tissue sensitivity values. SAR was scaled for conditions where the tissue permittivity was measured above the nominal target and for tissue conductivity that was measured below the nominal target. Negative or reduced SAR scaling is not permitted.

#### 12.6 DUT Test Plan

The guidelines and requirements outlined in section 4.0 were used to assess compliance of this device. All modes of operation identified in section 6.0 were considered during the development of the test plan.

Standalone BT testing was assessed in sections 13.3 per the guidelines of KDB 447498.

WLAN 2.4GHz tests were performed in 802.11b mode using a duty cycle of 99.97%. WLAN 5GHz tests were performed in 802.11 ac mode using a duty cycle of 98.00% with results scaled to 100% as per guidelines of KDB 248227.

#### 13.0 DUT Test Data

# 13.1 WLAN assessment at the Body

#### Assessments at the Body with offered Body worn

Assessment for the new introduced body worn accessory at the body were done with antenna and battery indicate in section 7.0 which represent the highest applicable configurations at the body found during the initial compliance assessment on filed with the FCC/ISED.

Table 16

Antenna	Battery	Carry Accessory	Cable Accessory	Test Freq (MHz)	Init Pwr (W)	SAR Drift (dB)	Meas. 1g- SAR (W/kg)	Max Calc. 1g-SAR (W/kg)	Run#

#### 13.2 Assessment for ISED, Canada

As per ISED Notice 2016-DRS001, additional tests were required for the low, mid and high frequency channels for the configuration with the highest SAR value. The SAR results are in Tables below. SAR plot of the highest results per Table 17 (bolded) are presented in Appendix E.

Table 17

## 13.3 Assessment at the Bluetooth band

Per guidelines in KDB 447498, the following formula was used to determine the test exclusion for standalone Bluetooth transmitter;

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] \*[ $\sqrt{F_{(GHz)}}$ ] = 2.75, which is  $\leq$  3 for 1-g SAR or 7.5 for 10-g extremity

#### Where:

Max. power = 8.74 mW (11.2 mW\*78% duty cycle)Min. test separation distance = 5 mm for actual test separation < 5 mm F(GHz) = 2.48 GHz

Per the result from the calculation above, the standalone SAR assessment was not required for Bluetooth band. Therefore, SAR results for Bluetooth are not reported herein.

#### 14.0 Simultaneous Transmission

WLAN 2.4GHz, 5GHz and BT share the same chipset, transmission path and antenna. The transmissions of these technologies are controlled by switching which only allows one technology to transmit at a single time and therefore do not support simultaneous transmission.

# 15.0 Results Summary

Based on the test guidelines from section 4.0 and satisfying frequencies within FCC bands, the highest Operational Maximum Calculated 1-gram average SAR values found for this filing:

Table 18

Designator	Frequency band (MHz)	Max Calc at Body (W/kg) 1g-SAR
FCC / ISED	2.4 GHz (WLAN 802.11 b/g/n)	0.37
Canada	5 GHz (WLAN 802.11 ac/n)	0.42

The test results clearly demonstrate compliance with FCC General Population/Uncontrolled RF Exposure limits of 1.6 W/kg averaged over 1 gram per the requirements of FCC 47 CFR § 2.1093.

# 14.0 Variability Assessment

Per the guidelines in KDB 865664 SAR variability assessment is not required because SAR results are below 0.8 W/kg (General Population / Uncontrolled).

## 15.0 System Uncertainty

A system uncertainty analysis is not required for this report per KDB 865664 because the highest report SAR value General Population / Uncontrolled exposure is less than 1.5W/kg.

Per the guidelines of ISO 17025 a reported system uncertainty is required and therefore measurement uncertainty budget is included in Appendix A.

Calibration procedure for dosimetric E-field probes

Calibration date:

March 20, 2018

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI). The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature (22 ± 3)°C and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

Glossary:

TSL tissue simulating liquid
NORMx,y,z sensitivity in free space
ConvF sensitivity in TSL / NORMx,y,z
DCP diode compression point

CF crest factor (1/duty\_cycle) of the RF signal modulation dependent linearization parameters

Polarization φ rotation around probe axis

Polarization & rotation around an axis that is in the plane normal to probe axis (at measurement center),

i.e.,  $\vartheta = 0$  is normal to probe axis

Connector Angle information used in DASY system to align probe sensor X to the robot coordinate system

#### Calibration is Performed According to the Following Standards:

 IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013

 EC 62209-1, ", "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from handheld and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz)", July 2016

c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010

d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization ⊕ = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz: R22 waveguide).
   NORMx,y,z are only intermediate values, i.e., the uncertainties of NORMx,y,z does not affect the E²-field uncertainty inside TSL (see below ConvF).
- NORM(f)x,y,z = NORMx,y,z \* frequency\_response (see Frequency Response Chart). This linearization is
  implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included
  in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- Ax,y,z; Bx,y,z; Cx,y,z; Dx,y,z; VRx,y,z: A, B, C, D are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for f ≤ 800 MHz) and inside waveguide using analytical field distributions based on power measurements for f > 800 MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx,y,z \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz.
- Spherical isotropy (3D deviation from isotropy): in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMx (no uncertainty required).
