SECTION 3 : Test standard information

3.1 Requirements for compliance testing defined by the FCC

The US Federal Communications Commission has released the report and order "Guidelines for Evaluating the Environmental Effects of RF Radiation", ET Docket No. 93-62 in August 1996. The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g for an uncontrolled environment and 8.0 mW/g for an occupational/controlled environment as recommended by the ANSI/IEEE standard C95.1-1992. According to the Supplement C of OET Bulletin 65 "Evaluating Compliance with FCC Guide-lines for Human Exposure to Radio frequency Electromagnetic Fields", released on Jun 29, 2001 by the FCC, the device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling.

1 Specific Absorption Rate (SAR) is a measure of the rate of energy absorption due to exposure to an RF transmitting source (wireless portable device).

2 IEEE/ANSI Std. C95.1-1992 limits are used to determine compliance with FCC ET Docket 93-62.

3.2 Procedure and result

TEST Outline

This EUT is built into the limited transmitter which used with the limited digital camera of similar composition (variant model).

Therefore the SAR test was performed with the limited transmitter and digital camera as a host device.

The details of limited transmitter and digital camera were shown in the Appendix 1.

3.3 Exposure limit

(A) Limits for Occupational/Controlled Exposure (W/kg)

Spatial Average (averaged over the whole body)	Spatial Peak (averaged over any 1g of tissue)	Spatial Peak (hands/wrists/feet/ankles averaged over 10g)
0.4	8.0	20.0

(B) Limits for General population/Uncontrolled Exposure (W/kg)

Spatial Average (averaged over the whole body)	Spatial Peak (averaged over any 1g of tissue)	Spatial Peak (hands/wrists/feet/ankles averaged over 10g)
0.08	1.6	4.0

Occupational/Controlled Environments: are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

General Population/Uncontrolled Environments: are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

**NOTE:GENERAL POPULATION/UNCONTROLLED EXPOSURE

3.5 Confirmation before SAR testing

3.5.1 Correlation of Output Power between EMC and SAR tests

It was checked that the antenna port power was correlated within 0~+5% (FCC requirements)

The result is shown in Section 6.1.

- Output power at EMC test

EMC power was measured during EMC testing (S/N: 7005).

-11a(5180-5320) mode was measured the average output power as a reference data for SAR power.

-11a(5500-5700) mode was measured the average output power as a reference data for SAR power.

-11a(5745-5825) mode was measured the peak output power in the FCC 15.247.

-11b/g mode was measured the peak output power in the FCC 15.247.

- Output power at SAR test

SAR power was measured before SAR testing (S/N: 7015).

-11a(5180-5320) mode was measured the average output power.

-11a(5500-5700) mode was measured the average output power.

-11a(5745-5825) mode was measured the peak output power.

-11b mode was measured the peak output power.

3.5.2 Average power for SAR testing

Step.1 Data rate check

The data rate check was measurement all data rate in the middle frequency of each frequency band.

3.6 Confirmation after SAR testing

It was checked that the power drift [W] is within $\pm 5\%$. The verification of power drift during the SAR test is that DASY4 system calculates the power drift by measuring the e-field at the same location at beginning and the end of the scan measurement for each test position.

DASY4 system calucation Power drift value[dB] = $20\log(E_a)/(E_b)$

Before SAR testing : $E_b[V/m]$

After SAR testing : $E_a[V/m]$

Limit of power drift[W] = $\pm 5\%$

$X[dB] = 10\log[P] = 10\log(1.05/1) = 10\log(1.05) - 10\log(1) = 0.212dB$

from E-field relations with power.

$S = E \cdot H = E^2 / \eta = P / 4 \pi r^2$ (η : Space impedance)

$P = E^2 \cdot 4 \pi r^2 / \eta$

Therefore, The correlation of power and the E-field

$X[dB] = 10\log(P) = 10\log(E)^2 = 20\log(E)$

From the above mentioned,

The calculated power drift of DASY4 System must be the less than $\pm 0.212dB$.

3.7 Measurement procedure

1. IEEE 802.11a mode

As for the SAR measurement of each band in the 11a mode, it was repeated from Step1 to Step3.

Step1. The data rate in the higher average power* of each modulation was decided, then the worst modulation was searched in the SAR testing.

Step2. The searching for the worst position

This test was performed at the worst modulation of Step 1

Step3. Channel change

This test was performed at the worst position of Step 1 to Step2.

Step4. Separation change for 5GHz band

The measurement was performed with the distance, 5mm and 10mm to check if the shortest distance may not have the worst value at the conditions of the highest SAR value.

2. IEEE 802.11b

The 11b (DSSS) mode test was performed on the DQPSK[2Mbps] modulation, because it was the maximum average power.

Step5. The searching for the worst position

Step6. Change to the Low and High channels

This test was performed at the worst conditions of Step5.

Step7. Separation change for 2.4GHz band

The measurement was performed with the distance, 5mm and 10mm to check if the shortest distance may not have the worst value at the conditions of the highest SAR value.

3. IEEE 802.11g

According to the KDB 248227 (Rev1.2) SAR Measurement Procedures for 802.11 a/b/g Transmitters, SAR is not required for 802.11g channels when the maximum average output power is less than $1/4$ dB higher than that measured on the corresponding 802.11b channels. Refer to theSection 6.

3.8 Test setup of EUT

When users operate or carry the EUT, it could be considered to touch or get close to their bodies. In order to assume this situation, we performed the test at the following positions. Please refer to "APPENDIX 1" for more details.

(1) Side :

The test was performed in touch with Side surface of the transmitter to the flat phantom.

(2) Front:

The test was performed in touch with Front surface of the transmitter to the flat phantom.

(3) Rear:

The test was performed in touch with Rear surface of the transmitter to the flat phantom.

(4) Bottom :

The test was performed in touch with Bottom surface of the transmitter to the flat phantom.

(5) Side (5mm) :

The measurement opened 5mm distance between the transmitter and flat phantom.

(6) Side (10mm) :

The measurement opened 10mm distance between the transmitter and flat phantom.

(7) Front (5mm) :

The measurement opened 5mm distance between the transmitter and flat phantom.

(8) Front (10mm) :

The measurement opened 10mm distance between the transmitter and flat phantom.
