# **SAR TEST REPORT**

Test Report No.: 10840760S-A

**Applicant** : Canon Inc.

Type of Equipment : Wireless Module

Model No. : ES200 (\*. It was installed into ES200's platform (3).)

FCC ID : AZD230

Test Standard : FCC 47CFR §2.1093

Test Result : Complied

| Highest Reported     | 1 SAR(1g)   | Platform | Platform type  | Platform | Remarks |           |                 |                  |                 |  |  |  |  |

| *. This Wireless Mod | *. This Wireless Module had installed into the following platforms under 0.8W/kg of reported SAR(1g) (KDB447498 D01 (v06); multi-platform operation requirement). |          |                |          |         |           |                 |                  |                 |  |  |  |  |
| 0.15 W/kg            | 0.123 W/kg  | #1       | Digital camera | DS126621 | DTS     | 2437 MHz  | 11b(1Mbps,DSSS) | 12.79 dBm (Ave.) | 10840761S-A     |  |  |  |  |
| < 0.10 W/kg          | 0.056 W/kg  | #2       | Digital camera | DS126591 | DTS     | 2462 MHz  | 11b(1Mbps,DSSS) | 12.62 dBm (Ave.) | 10840759S-A     |  |  |  |  |

<sup>\*.</sup> Highest reported SAR (1g) across all exposure conditions and on the platforms = "0.60 W/kg" = grant listed.

- 1. This test report shall not be reproduced in full or partial, without the written approval of UL Japan, Inc.
- 2. The results in this report apply only to the sample tested.
- 3. This sample tested is in compliance with the limits of the above regulation.
- 4. The test results in this test report are traceable to the national or international standards.
- 5. This test report must not be used by the customer to claim product certification, approval, or endorsement by any agency of the Federal Government
- 6. The opinions and the interpretations to the result of the description in this report are outside scopes where UL Japan has been accredited.
- 7. This test report covers Radio technical requirements. It does not cover administrative issues such as Manual or non-Radio test related Requirements. (if applicable)

**Date of test:** April 21, 2016

Test engineer: Roke

Hiroshi Naka

Engineer, Consumer Technology Division

Approved by: mamua

Toyokazu Imamura

Leader, Consumer Technology Division

Since highest reported SAR (1g): <0.10 W/kg on a platform of ES200 (EUT) which obtained in accordance with KDB447498 (v06) was kept under 0.8 W/kg, this EUT was approved to operate multi-platform (which were tested in above.).</p>

# **SECTION 3:** Test specification, procedures and results

### 3.1 Test specification

The US Federal Communications Commission has released the report and order "Guidelines for Evaluating the Environmental Effects of RF Radiation", ET Docket No. 93-62 in August 1996. The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g for an uncontrolled environment and 8.0 mW/g for an occupational/controlled environment as recommended by the ANSI/IEEE standard C95.1-1992. The device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling in accordance with the following measurement procedures.

KDB 447498 D01 (v06): General RF exposure guidance

**KDB 248227 D01 (v02r02):** SAR Guidance for IEEE 802.11 (Wi-Fi) transmitters

KDB 865664 D01 (v01r04): SAR measurement 100MHz to 6GHz

IEEE Std. 1528-2013: IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in

the Human Head from Wireless Communications Devices: Measurement Techniques.

### 3.2 Exposure limit

| Environments of exposure limit                                     | Whole-Body (averaged over the entire body) | Partial-Body<br>(averaged over any 1g of tissue) | Hands, Wrists, Feet and Ankles<br>(averaged over any 10g of tissue) |
|--|--|--|---|
| (A) Limits for Occupational<br>/Controlled Exposure (W/kg)         | 0.4  | 8.0  | 20.0  |
| (B) Limits for General population<br>/Uncontrolled Exposure (W/kg) | 0.08                                       | <u>1.6</u>                                       | 4.0   |

<sup>\*.</sup> Occupational/Controlled Environments:

are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

### The limit applied in this test report is;

General population / uncontrolled exposure, Partial-Body (averaged over any 1g of tissue) limit: 1.6 W/kg

### 3.3 Procedures and Results

|                                     | Wi-Fi (DTS) / in Platform (3)                                      |
|-------------------------------------|--|

| Category                            | FCC 47CFR §2.1093 (Portable device)                                |
| Results (SAR(1g))                   | Complied   |
| Reported SAR value (*. Scaled)      | 0.60 W/kg  |
| Measured SAR value                  | 0.508 W/kg   |
| Operation mode, channel             | 802.11b, 1 Mbps (DBPSK/DSSS), 2437 MHz (6ch)                       |
| Power measured/max. (scaled factor) | 12.79 dBm/13 dBm (×1.18)   |
| Duty cycle [%] (scaled factor)      | 99.9 (×1.00)   |

Note: UL Japan's SAR Work Procedures No.13-EM-W0429 and 13-EM-W0430. No addition, deviation nor exclusion has been made from standards

Test outline: Where this product is built into a new platform (3), it was verified whether multiplatform conditions can be suited in according with section 2) of 5.2.2 in KDB447498 D01 (v06).

Consideration of the test results: The highest reported SAR (1g) of this platform (3) was kept;  $\leq 0.8$  W/kg.

Since highest reported SAR (Ig) on this EUT's platform obtained in accordance with KDB447498 D01 (v06) was kept under 0.8 W/kg, this EUT was approved to operate multi-platform.

#### 3.5 **Confirmation before SAR testing**

### 3.5.1 Average power for SAR tests

Before SAR test, the RF wiring for the sample had been switched to the antenna conducted power measurement line from the antenna line and the average power was measured. The result is shown in Section 6.

The EUT transmission power was verified that it was within 2dB lower than the maximum tune-up tolerance limit when it was set the rated power. (Clause 4.1, KDB447498 D01(v06))

### Check the power by data rate and operation channel

The data rate check was measured for all modes in one of default channel. For the SAR test reference, the average output power was measured on the lower, middle, upper channels with the worst data rate condition in.

#### Confirmation after SAR testing 3.6

It was checked that the power drift [W] is within ±5% in the evaluation procedure of SAR testing. The verification of power drift during the SAR test is that DASY5 system calculates the power drift by measuring the e-filed at the same location at beginning and the end of the scan measurement for each test position.

The result is shown in APPENDIX 2.

DASY5 system calculation Power drift value[dB] =20log(Ea)/(Eb) (where, Before SAR testing: Eb[V/m] / After SAR testing: Ea[V/m])

Limit of power drift[W] =  $\pm 5\%$ 

Power drift limit ( $\vec{X}$ ) [dB] =  $10\log(P \text{ drift})=10\log(1.05/1)=10\log(1.05)-10\log(1)=0.21\text{dB}$ 

from E-filed relations with power.

 $S=E\times H=E^2/\eta=P/(4\times \pi\times r^2)\ (\eta\colon Space\ impedance) \to P=(E^2\times 4\times \pi\times r^2)/\eta$ 

Therefore, The correlation of power and the E-filed

Power drift limit (X) dB=10log(P\_drift)=10log(E\_drift)^2=20log(E\_drift)

From the above mentioned, the calculated power drift of DASY5 system must be the less than ±0.21dB.

- \* D: Antenna separation distance. It is the distance from the EUT antenna inside a platform to the outer surface of platform which an operator may touch.
- \*. Size of EUT (ES200): 11.5 mm (width) × 22.5 mm (depth) × 2.0 mm max (thickness)
- \*. Size of platform: 150.7 mm (width) × 116.4 mm (height) × 75.9 mm (depth) (\*. The lens unit is detached. The convex portion is not contained in size.)

### \*1. KDB 447498 D01 (v06) was taken into consideration to reduce SAR test.

| (b,g)  | Bottom   | ≈110 | 101               | 2.462              | 13.50 | 22.39 | 22                | 706                            | Reduced    | -       |  |  |

<sup>\*2.</sup> Parenthesis 1), Clause 4.3.1, KDB 447498 D01 (v06) gives the following formula to calculate the SAR(1g) test exclusion thresholds for 100MHz-6GHz at test separation distance ≤50mm.

### <Conclusion for consideration for SAR test reduction>

- 1) The SAR setups for the near antenna which includes Top, Top-front, Top-left-front, Top-front-left, Front-top and Rear are considered body-touch SAR and are applied the SAR test in body-liquid.
- 2) The SAR tests for Left, Bottom and Right setup are reduced because there is enough antenna separation distance.
- 3) Since the Rear (LCD) setup condition has enough antenna separation distance and has small SAR value (in body liquid), SAR test of head liquid (front-of-face) was reduced.

By the determined test setup shown above, the SAR test was applied in the following procedures.

| Cton 1 | Worst SAR search of DSSS mode;  |
|--------|---|
| Step 1 | Determine the highest reported SAR(1g) of DSSS mode. (*. Change the channel, if it is necessary.) |
| Step 2 | Check SAR of OFDM mode;   |
|        | Check the SAR of OFDM mode at the worst SAR condition of DSSS mode in above step1.                |

<sup>\*.</sup> During SAR test, the radiated power is always monitored by Spectrum Analyzer.

<sup>[(</sup>max.power of channel, including tune-up tolerance, mW)/(min.test separation distance, mm)]  $\times$  [ $\sqrt{f(GHz)}$ ]  $\leq$  3.0 (for SAR(1g)) ············formula (1) If power is calculated from the upper formula (1);

<sup>\*3.</sup> Parenthesis 2), Clause 4.3.1, KDB 447498 D01 (v06) gives the following formula to calculate the SAR(1g) test exclusion thresholds for 1.5-6GHz at test separation distance >50mm.

 <sup>[</sup>test exclusion thresholds, mW] = [(Power allowed at numeric threshold for 50mm in formula (1))] + [(test separation distance, mm) - (50mm)] × 10 formula (3)
 \*4. Even if a SAR test was judged exclusion by SAR threshold power, these setup conditions are considered body-touch SAR and are applied the SAR test in body-liquid., because the antenna separation distance is small.

# **SECTION 4:** Operation of EUT during testing

### 4.1 Operating modes for SAR testing

This EUT has IEEE.802.11b, 11g and 11n(20HT) continuous transmitting modes.

The frequency and the modulation used in the SAR testing are shown as a following.

| (                | Operation mode             | 11b                           | 11g          | 11n(20HT)   |  |  |  |  |  |  |  |

<sup>\*.</sup> Table of uncertainties are listed for ISO/IEC 17025.

1-22-3 Megumigaoka, Hiratsuka-shi, Kanagawa-ken, 259-1220 JAPAN Telephone: +81 463 50 6400 / Facsimile: +81 463 50 6401

<sup>\*2. (</sup>KDB248227 D01 (v02r02)) Since the reported SAR of the highest measured maximum output power channel is ≤0.8 W/kg, the SAR testing for other channels were omitted. However, the SAR testing was applied to lower, middle and upper channels for the worst SAR condition.

<sup>\*</sup> This measurement uncertainty budget is suggested by IEEE Std.1528(2013) and determined by Schmid & Partner Engineering AG (DASY5 Uncertainty Budget). Per KDB 865664 D01 (v01r04) SAR Measurement 100 MHz to 6 GHz, Section 2.8.1., when the highest measured SAR(1g) within a frequency band is < 1.5W/kg, the extensive SAR measurement uncertainty analysis described in IEEE Std.1528 (2013) is not required in SAR reports submitted for equipment approval.

Test report No. : 10840760S-A Page : 9 of 45 Issued date : May 10, 2016

FCC ID : AZD230

# **SECTION 6:** Confirmation before testing

<sup>\*.</sup> SAR test was applied. \*. xx.xx highlight is shown the maximum measured output power.

\*. Calculating formula: Average power-result: Results (dBm) = (P/M Reading, dBm)+(Cable loss, dB)+(Attenuator, dB)+(duty factor, dB)

Duty factor: (duty factor, dBm) =  $10 \times \log (100/(\text{duty cycle, }\%))$ 

Deviation form max.: (Power deviation, dB) = (results power (average, dBm)) - (Max.-specification output power (average, dBm)) Duty scaled factor: Duty cycle correction factor for obtained SAR value, Duty scaled factor [-] = 100(%)/(duty cycle, %) Tune-up factor: Power tune-up factor for obtained SAR value, Tune-up factor [-] =  $1/(10 \land (\text{`Coeviation from max., dB''}/10))$ 

- \*. The power data above-mentioned diverted a result of measurement of EMC test of report identifier: 10840757S-G.
- \*. The ES200 of serial number: 2 with which power was measured in EMC test was used for a SAR test.
- \*. Uncertainty of antenna port conducted test; Power measurement uncertainty above 1GHz for this test was: (±) 0.76 dB(Average)/(±) 0.79 dB(Peak)

# Notes:

- \*. Gap: It is the separation distance between the nearest position of platform outer surface and the bottom outer surface of phantom;
- Bty.: Battery; Max.: maximum, Meas.: Measured; n/a: not applied.

  \*. Battery ID No.15 and #23 are same. Refer to Appendix 1 for more detail.
- \*. During test, the EUT was operated with full charged battery and without all interface cables.

\*. Calibration frequency of the SAR measurement probe (and used conversion factors)

| SAR test frequency   | Probe calibration frequency | Validity                               | Conversion factor | Uncertainty |
|----------------------|-----------------------------|--|-------------------|-------------|
| 2412, 2437, 2462 MHz | 2450MHz                     | within ±50MHz of calibration frequency | 7.17              | ±12.0%      |

\*. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band.

- \*a. The target value is a parameter defined in Appendix A of KDB865664 D01 (v01r04), the dielectric parameters suggested for head and body tissue simulating liquid are given at 2000 and 2450MHz. Parameters for the frequencies 2000-2450MHz were obtained using linear interpolation. (Refer to appendix 3-4.)
- \*b. Refer to KDB865664 D01 (v01r04), item 2), Clause 2.6; "When nominal tissue dielectric parameters are recorded in the probe calibration data; for example, only target values and tolerance are reported, the measured ar and σ of the liquid used in routine measurements must be: ≤ the target ar and ≥ the target σ values and also within 5% of the required target dielectric parameters."
- \*c. Calculating formula:  $\Delta SAR(1g) = C \hat{\epsilon} r \times \Delta \hat{\epsilon} r + C \sigma \times \Delta \sigma$ ,  $C \hat{\epsilon} = -7.854E + 4 \times \hat{r}^2 + 9.402E 3 \times \hat{r}^2 2.742E 2 \times \hat{r} 2.0226 / C \sigma = 9.804E 3 \times \hat{r}^2 8.661E 2 \times \hat{r}^2 + 2.981E 2 \times \hat{r} + 0.7829$

 $\Delta SAR \text{ corrected SAR (1g) (W/kg)} = (Meas. SAR(1g) (W/kg)) \times (100 - (\Delta SAR(\%)) / 100$ 

\*d. Calculating formula: Reported SAR (1g)  $(W/kg) = (Measured SAR (1g) (W/kg)) \times (Duty scaled) \times (Tune-up factor)$ 

Duty scaled = Duty scaled factor: Duty cycle correction factor for obtained SAR value, Duty scaled factor [-] = 100(%)/(duty cycle, %)Tune-up factor: Power tune-up factor for obtained SAR value, Tune-up factor [-] =  $1/(10^{\%})$ 0.

### (Clause 5.2, 2.4GHz SAR Procedures, in KDB248227 D01 (v02r02))

5.2.1 802.11b DSSS SAR Test Requirements

SAR is measured for 2.4 GHz 802.11b DSSS using either a fixed test position or, when applicable, the initial test position procedure. SAR test reduction is determined according to the following:

- 1) When the reported SAR of the highest measured maximum output power channel (section 3.1) for the exposure configuration is ≤0.8 W/kg, no further SAR testing is required for 802.11b DSSS in that exposure configuration.
- When the reported SAR is > 0.8 W/kg, SAR is required for that exposure configuration using the next highest measured output power channel. When any reported SAR is > 1.2 W/kg, SAR is required for the third channel; i.e., all channels require testing.
- 5.2.2 2.4 GHz 802.11g/n OFDM SAR Test Exclusion Requirements

When SAR measurement is required for 2.4 GHz 802.11g/n OFDM configurations, the measurement and test reduction procedures for OFDM are applied (section 5.3, including sub-sections). SAR is not required for the following 2.4 GHz OFDM conditions.

- 1) When KDB Publication 447498 SAR test exclusion applies to the OFDM configuration.
- 2) When the highest reported SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is ≤1.2 W/kg.
