Shirley,
regarding your question for a tune up procedure of our MC56 , the MC56 is a fully FCC and PTCRB approved device
and for the first filing we used the same tune up documents for FCC as we provided it to you (Siemens HID MC56 doc.)
and FCC/TCB was satisfied. When the customer is implementing our module in his application the customer could not
modify any parameter of our module, there is no access to tune up the power out put of the module or any other parameter
the serial interface is locked internally for tune procedure. For the customer it is only possible to connect his own antenna
to our device.

Of course could w Siemens provide you with the TCF docs for second filing for the Verifone product.
Please let me know your comments.

Best regards

Uwe Peters
