# GE Interlogix, Inc

## 1. Introduction

This device is a radio repeater. It receives and processes data from existing GE Interlogix 319.5MHz sensors. If required, it transmits information via a 902 - 928MHz Frequency Hopping Spread Spectrum (FHSS) link to a base station receiver, which may in turn be connected to a personal computer or security panel via a hardwired connection.

The transmitter uses the 902-928MHz ISM band, operating as a FHSS device. We are requesting Certification under FCC Rules, Part 15, Subpart C, Paragraph 15.247.

Power is supplied to the device via a 16.5VAC Class 2 transformer. A 12V lead acid battery provides backup power. The enclosure measures approximately 6.75" by 6.25" by 2.25". The antennas protrude approximately 9.25" above the enclosure. The unit weighs approximately 3 pounds, 4 ounces, including battery and transformer.

Please send comments/suggestions on the report to paul.saldin@ge.com.

Grantee Code: B4Z

## 2. Statement of Compliance

### §2.907 Certification

This is an application for certification

### §2.911 Application

- a) This is an application and has been filed electronically with form 731.
- b) All information required has been supplied.
- c) The applicant has signed the application (electronically).
- d) The technical data has been signed.
- e) Applicant signature block on electronic form 731 completed by officer of the company or authorized company personnel.
- f) The appropriate fee has been paid electronically with VISA on 7/24/2003.

### §2.915 Grant

This application demonstrates that all applicable technical standards have been met and a grant of this application will serve the public interest.

FCC_REPT.DOC 07/24/03 11:42 AM	FCC ID: B4Z-855-NODE	Page 4 of 11
-----------------------------------	----------------------	--------------

## GE Interlogix, Inc

### §2.925 Label

Each piece of equipment for which authorization will be granted will be uniquely identified with "FCC ID: B4Z-855-NODE." The required statement will appear with the FCC ID on the product. See Exhibit A, "*id\_label.pdf*".

### §2.947 Measurement Procedure

- a) The scan of the restricted bands was made in a radiated manner, with AC cord and USB cable connected. The radiated measurement procedure follows ANSI C63.4 procedure.
- b) All other RF measurements were made in a conducted manner.
- c) Procedural notes are contained in the laboratory report.
- d) A list of test equipment used is contained in the laboratory report.

### §2.948 Description of Measurement Facilities

Measurements were performed at TUV Testing Services Open Test Site. The FCC keeps a full description of the measurement facilities on file. TUV's acceptance and approval is dated as December 5, 1993 in a letter received from the FCC.

The address of the test facility is:

TUV Product Service  
19035 Wild Mountain Road  
Taylors Falls, MN 55084-1758

Phone: 651-638-0297  
Contact: Joel Schneider  
Test Engineer in Charge

See Exhibit B, "*test\_pho.pdf*", for sketch of radiated measurement setup.

### §2.1033 Application for Certification

- a) Form 731 has been electronically filed on 7/24/03. Items that did not apply were left blank.
- b) This technical report contains the following information where applicable.
  - 1) Full name and mailing address of manufacturer and applicant for certification:  
GE Interlogix, Inc.  
2266 North Second Street  
North Saint Paul, MN 55109

FCC_REPT.DOC 07/24/03 11:42 AM	FCC ID: B4Z-855-NODE	Page 5 of 11
-----------------------------------	----------------------	--------------

## GE Interlogix, Inc

- 2) FCC Identifier:  
**B4Z-855-NODE**
- 3) Copy of installation instructions:  
See Exhibit C, "*install\_man.pdf*"
- 4) Brief Description of circuit functions and device operation:  
See Exhibit D, "*op\_desc.pdf*" for operational description.  
See Exhibit E, "*schematic.pdf*" for schematic.  
See Exhibit F, "*ppd.pdf*" for parts placement diagram.
- 5) Block Diagram  
See Exhibit G, "*block.pdf*".
- 6) Report of the measurements of radiated and conducted emissions:  
Exhibits P through Z show data and plots, and are discussed later in this report.
- 7) Photographs  
External:  
See Exhibit H, "*extern.pdf*".  
Internal:  
See Exhibit I, "*intern.pdf*".
- 8) Peripheral or Accessory devices:  
This device is designed to interface to a personal computer over the USB. It obtains initial configuration information from the personal computer. This link is used only for a brief time during installation of the device.
- 9) Transition Rules  
This application is not pursuant to the transition rules of §15.37.
- 10) Application for scanning receivers:  
Not applicable to this device.
- 11) Application for operation within the 59 – 64GHz band:  
Not applicable to this device.
- c) Composite Systems  
Not applicable to this device.

### 3. Lab Measurements Discussion / Test Notes

#### 3.1 Frequencies to be Examined [**§15.31(m)**]

In accordance with the guidelines of §15.31(m), all conducted and radiated measurements were performed at the lower, middle, and upper frequencies of the 902-928MHz band.

#### 3.2 Antenna Requirement [ **§15.203** ]

The transmitter antenna is permanently soldered to the circuit board, and therefore complies with the requirement that no other antenna shall be used with the device.

#### 3.3 Antenna Characteristics [ **§15.204** ]

There is only one antenna proposed for use with this device. This antenna has the following characteristics:

##### 3.3.1 Antenna Type

The antenna is approximately a  $\frac{3}{4}$  wave monopole at 900MHz.

##### 3.3.2 Antenna Manufacturer

None; the antenna is a simple wire soldered to the circuit board.

##### 3.3.3 Antenna Gain

The gain of the antenna was measured using the substitution method. A Roberts-style dipole of known gain was used as the reference antenna. Characteristics of the reference antenna were as follows:

Manufacturer: EMC Test Systems  
Model Number: DB-4  
Serial Number: 1631  
Gain at 900MHz: 1.1dBi (from EMC calibration data)

The reference was driven at 900MHz by a signal generator and rotated to find the peak orientation. A spectrum analyzer was used to record the peak. Keeping the identical test setup, the same measurement was made with the DUT antenna.

The following data was taken:

Reference antenna recorded peak: -54.0dBm  
DUT antenna recorded peak: -54.8dBm

The DUT antenna was fed through a bazooka-type balun of negligible loss. The return loss of the DUT antenna was measured to be 5.0dB, with a resulting transmission loss of 1.65dB.

Using the above data and measurements, the gain of the DUT antenna is calculated as

FCC_REPT.DOC 07/24/03 11:42 AM	FCC ID: B4Z-855-NODE	Page 7 of 11
-----------------------------------	----------------------	--------------

## GE Interlogix, Inc

Gain = ref gain + (DUT peak – ref peak) + DUT transmission loss

$$= 1.1 + (-54.8 - (-54.0)) + 1.65 = \mathbf{1.95dB}$$

### 3.4 Public Utility Power Line Measurements [ §15.207 ]

The voltage conducted back onto the AC power line was measured and found to be in compliance with the Class B limits. Please see Exhibit P, “*ac line conducted emissions.pdf*”.

### 3.5 Frequency Hopping System Description[ §15.247(a) ]

This system meets the definition of a frequency hopping spread spectrum system as follows:

#### 3.5.1 Carrier Frequency Separation

Carrier frequency separation is 524kHz. This meets the requirement that it be greater than the 20dB bandwidth, which is 140kHz. See Exhibit Q, “*channel separation.pdf*” and Exhibit R, “*20dB bandwidth.pdf*”.

#### 3.5.2 Randomization of Hopping Frequencies

A pseudorandomly ordered list of 50 hopping frequencies is used for carrier frequency selection. This list resides in non-volatile memory within the microcontroller. On each new hop, the software selects the next frequency in the list, resulting in a pseudorandom distribution and an equal use of each frequency on average. See Exhibit J, “*random freq list.pdf*”.

#### 3.5.3 System Receiver Description

See Exhibit D, “*op\_desc.pdf*” for a description of the system receiver.

#### 3.5.4 Number of Hopping Frequencies

The system uses 50 hopping frequencies as required. See Exhibit J, “*random freq list.pdf*” for the list of the frequencies. See Exhibit S, “*number of hops.pdf*” for a plot showing usage of 50 frequencies. This plot was made by setting the spectrum analyzer to peak hold and presenting the transmitter with a continuous data stream.

#### 3.5.5 Time of Occupancy

The dwell time on each frequency is 55.5msec. See Exhibit T, “*dwell time.pdf*” for a plot of the packet length. The software enforces a minimum interpacket delay of 46msec. This minimum delay between hops, in conjunction with the provision that all 50 hopping frequencies are used equally on average, guarantees that the transmitter shall not occupy any frequency for more than 0.4 seconds in a 20 second period.

FCC_REPT.DOC 07/24/03 11:42 AM	FCC ID: B4Z-855-NODE	Page 8 of 11
-----------------------------------	----------------------	--------------

## GE Interlogix, Inc

### 3.5.6 20dB Bandwidth

The 20dB bandwidth of the modulated transmission is 140kHz. This complies with the requirement that the bandwidth be less than 500kHz. See Exhibit R, “*20dB Bandwidth.pdf*”.

### 3.6 Output Power [§15.247(b)]

#### 3.6.1 Peak Output Power

The peak output power of the transmitter is in compliance with the 1W limit for the low, middle and high channels. This data was taken with the unit operating in a continuous (non-modulated) manner. See Exhibit U, “*output power.pdf*” for the conducted test data.

#### 3.6.2 De Facto EIRP Limit

The gain of the transmit antenna is given earlier in this report. Because the gain of the antenna is less than 6dBi, the peak output power need not be reduced to comply with this requirement.

#### 3.6.3 RF Exposure Compliance Requirements

Because this device is intended to be mounted in a fixed location, neither the mobile device requirements of §2.1091 nor the portable device requirements of §2.1093 apply.

### 3.7 *Spurious Emissions* [ §15.247(c) ]

#### 3.7.1 **Band-Edge Compliance**

The transmitter was found to comply with the 20dB-down band-edge requirements with the hopping function both disabled and enabled.

In order to test with the hopping function disabled, the transmitter was put in a special mode in which it was locked on the low channel. Repeated data packets were then transmitted with the spectrum analyzer on peak hold at the low channel. The same test was then repeated for the high channel. The results of these tests are shown in Exhibit V, “*lower band edge no hop.pdf*” and Exhibit W, “*upper band edge no hop.pdf*”.

The hopping function was then enabled, and packets were transmitted until many had occurred at the low channel. The spectrum analyzer was once again on peak hold at the low channel. The same test was then repeated for the high channel. The results of these tests are shown in Exhibit X, “*lower band edge hop.pdf*” and Exhibit Y, “*upper band edge hop.pdf*”.

#### 3.7.2 **Spurious RF Conducted Emissions**

Spurious emissions not lying in restricted bands were tested in a conducted manner. These emissions were tested with the transmitter tuned to low, mid, and high channels and transmitting in a continuous manner.

The 2<sup>nd</sup> and 7<sup>th</sup> are the only harmonics that lie in non-restricted bands. The power conducted at these harmonics was found to comply with the requirement that it be 20dB down from the fundamental. See Exhibit U, “*output power.pdf*” for the conducted test data.

#### 3.7.3 **Spurious RF Radiated Emissions**

A complete scan was performed to determine the radiated field strength of spurious emissions falling within the restricted bands defined in §15.205. These emissions were tested with the transmitter tuned to low, mid, and high channels and transmitting in a continuous manner.

##### 3.7.3.1 *Calculation of allowed limit*

For spurs above 1000MHz, §15.205(b) allows duty cycle averaging per §15.35. The following is the derivation of the allowed duty cycle correction factor for this transmitter.

The transmitter employs amplitude modulation and transmits 208 bits. Each bit has an “ON” time of 122 μS. The total on time of a single packet is:

$$208 * 122 \mu S = 25.376 \text{ msec.}$$

## GE Interlogix, Inc

The interpacket delay time of 45mS, enforced by the software, ensures that only one packet is sent in any given 100mS window. The duty cycle correction factor is therefore:

$$20*\text{LOG}(25.376/100) = -11.91 \text{ dB}$$

The raw limit for spurs falling above 960MHz is given in §15.209 as 500 microvolts per meter, or 54 dBuV/m. After applying the duty cycle correction factor, the limit for this transmitter for spurs above 1000MHz in the restricted bands is:

$$54 - (-11.91) = 65.91 \text{ dBuV/m}$$

### 3.7.3.2 *Radiated Emissions Results*

Results of the radiated scan are shown in Exhibit Z, “*radiated emissions.pdf*”. These results show that all spurs lying in restricted bands above 1000MHz fall below the 65.91 dBuV/m limit. The highest spur was 3.5dB below the limit at 2.706GHz.

### 3.8 *True Frequency Hopping Compliance [ §15.247(g) ]*

The use of the pseudorandomly ordered frequency table, described previously in this report, guarantees that this system shall distribute its transmissions equally over 50 hopping channels should it be presented with a continuous data stream.

### 3.9 *Coordination of Systems [ §15.247(h) ]*

This device incorporates a 319.5MHz receiver and a 900MHz transmitter. It also provides a USB link to a PC. There are no other means of signaling to external devices. Since this device therefore has no means of communicating to other FHSS transmitters, it has no ability to coordinate its hopping in an effort to avoid simultaneous occupancy of individual hopping frequencies.
