1. Test Setup Description

1.1. Measurement System

The conducted power measurement test setup is described in the following and illustrated in Figure 1

- a. The DUT which is a Fibocom M2 L850-GL module contains the XMM 7360 Cellular Modem and installed inside HP model HSC-I001R convertible notebook.
- b. The control PC is used to configure the Call Box to send power control test sequences to the XMM 7360
- c. Uplink signal power is monitored by the Spectrum Analyzer and record by the PC with a time resolution of 25 msec which is substantially less than the power adjustment interval (Avg_SAR_Check_Period) of 1 sec used for XMM 7360.
- d. The values of Avg_SAR_Power are read from the XMM 7360 by the PC at each Avg_SAR_Check_Period
- e. In additional to power results, the time sequence of power control commands and power samples are also recorded by the PC to enable results to be correlated and plotted. Uplink signal from the XMM 7360 is fed through a 3 dB Power Splitter, which delivers an equal amount of signal to the Spectrum Analyser and the Call Box. The Splitter has high isolation between the Spectrum Analyser and the Call Box. Due to different Uplink/Downlink frequencies and the zero-span time-domain measurement used, interference of Uplink and Downlink sigals is avoided.
- f. Path loss in the power measurement setup from the XMM 7360 Main Antenna port to either the Call Box or the Spectrum Analyser is taken into account
