Subject: Explanation of Test Report

Dear Examiner,

This application for equipment approval uses the test report for the module that is used inside the host system (reference report number 80-N2162-203 Rev B, issued by Qualcomm and dated July 28, 2010) to demonstrate compliance with the antenna port measurement requirements of the FCC rules. The module is not modified by the system integrator and operates at the same maximum rated power as described in the test report. The test report for the stand-alone module remains representative of the module when used in the host system ofr the antenna port measurements.

System-level compliance (module installed in the host device) with radiated emissions requirements for both fundamental and spurious emissions is provided in a separate report.

Regards
Chi Tsou
