SAR TEST REPORT

**Test Report No.: 12669313S-A-R1** 

Applicant	:	CASIO COMPUTER CO., LTD.
Type of Equipment	:	RF Module
Model No.	:	WSD-F21 (*. It was installed into a limited host: WSD-F21 (Smart Outdoor Watch).)
FCC ID	:	BBQ-WSDF21
Test Standard	:	FCC 47CFR §2.1093
Test Result	:	Complied (Refer to Section 3.3)

RF Exposure Platform			Highest Reported SAR Value				Remark	Output power (average)		
Condition	Туре	Model	Туре	Tune-up value	Limit	Band	Frequency	Mode	Measured	Maximum
Extremity (Wrist)	Smart Outdoor	WSD E21	SAR (10g)	<0.10 W/kg	4	DTS	2462 MHz	11b(1Mbps)	16.28 dBm	18 dBm
Next-to-Mouth	Watch	W5D-F21	SAR (1g)	<0.10 W/kg	1.6	DTS	2437 MHz	11b(1Mbps)	16.38 dBm	18 dBm

\* 11b: IEEE 802.11b

\*. Highest reported SAR (1g) across all exposure conditions and on this platform is "<0.10 W/kg (10g, Wrist)" and "<0.10 W/kg (1g, Next-of-mouth)". This RF Module: WSD-F21 was only installed into the Smart Outdoor Watch which were listed in above.

This test report shall not be reproduced in full or partial, without the written approval of UL Japan, Inc. 1.

The results in this report apply only to the sample tested. 2.

This sample tested is in compliance with the limits of the above regulation. 3.

4. The test results in this test report are traceable to the national or international standards.

5. This test report must not be used by the customer to claim product certification, approval, or endorsement by any agency of the Federal Government.

This test report covers Radio technical requirements. 6.

It does not cover administrative issues such as Manual or non-Radio test related Requirements. (if applicable)

7. The all test items in this test report are conducted by UL Japan, Inc. Shonan EMC Lab.

The opinions and the interpretations to the result of the description in this report are outside scopes where UL Japan has been accredited. 8.

9. The information provided from the customer for this report is identified in SECTION 1.

Date of test:

March 4 and 5, 2019

**Test engineer:** 

Hiroshi Naka Engineer, Consumer Technology Division

Approved by:

ramic

Toyokazu Imamura Leader, Consumer Technology Division

The testing in which "Non-accreditation" is displayed is outside the accreditation scopes in UL Japan.

There is no testing item of "Non-accreditation".

#### **SECTION 3:** Test specification, procedures and results

#### **Test specification** 3.1

FCC47CFR 2.1093: Radiofrequency radiation exposure evaluation: portable devices.

General RF exposure guidance

The US Federal Communications Commission has released the report and order "Guidelines for Evaluating the Environmental Effects of RF Radiation", ET Docket No. 93-62 in August 1996. The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g for an uncontrolled environment and 8.0 mW/g for an occupational/controlled environment as recommended by the ANSI/IEEE standard C95.1-1992. The device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling in accordance with the following measurement procedures.

KDB 447498 D01 (v06): KDB 248227 D01 (v02r02): KDB 865664 D01 (v01r04): IEEE Std. 1528-2013:

SAR Guidance for IEEE 802.11 (Wi-Fi) transmitters SAR measurement 100MHz to 6GHz

IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques.

#### 3.2 **Exposure** limit

Environments of exposure limit	Whole-Body (averaged over the entire body)	Partial-Body (averaged over any 1g of tissue)	Hands, Wrists, Feet and Ankles (averaged over any 10g of tissue)		
(A) Limits for Occupational /Controlled Exposure (W/kg)	0.4	8.0	20.0		
(B) Limits for General population /Uncontrolled Exposure (W/kg)	0.08	1.6	4.0		

\*. Occupational/Controlled Environments:

are defined as locations where there is exposure that may be incurred by people who are aware of the potential for

exposure, (i.e. as a result of employment or occupation).

\*. General Population/Uncontrolled Environments: are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

#### The limit applied in this test report is;

General population / uncontrolled exposure, Extremity (averaged over any 10g of tissue) limit: 4 W/kg (Wrist) General population / uncontrolled exposure, Partial-Body (averaged over any 1g of tissue) limit: 1.6 W/kg (Next-to-Mouth) Tested platform is a wristwatch which support the voice command.

#### 3.3 **Procedures and Results**

### 3.6 Confirmation before SAR testing

Before SAR test, the RF wiring for the sample had been switched to the antenna conducted power measurement line from the antenna line and the average power was measured. The result is shown in Section 6.

\*. The platform transmission power was verified that it was within 2dB lower than the maximum tune-up tolerance limit when it was set the rated power. (Clause 4.1, KDB447498 D01 (v06))

Step.1 Data rate check (\*. The power measurement was applied to the following data rate in each operation mode.)

\*. Data rate: [Mbps]; SS: Spatial Stream; b: IEEE 802.11b, g: IEEE 802.11g, n20: IEEE 802.11n(20HT); BLE: Bluetooth Low Energy; BDR: Basic Data Rate; EDR: Enhanced Data Rate.

### Step.2 Consideration of SAR test channel

For the SAR test reference, on each operation band, the average output power was measured on the low/middle/upper and specified channels with the worst data rate condition in step 1 in the above.

### 3.7 Confirmation after SAR testing

It was checked that the power drift [W] is within  $\pm 5\%$  in the evaluation procedure of SAR testing. The verification of power drift during the SAR test is that DASY5 system calculates the power drift by measuring the e-filed at the same location at beginning and the end of the scan measurement for each test position. The result is shown in APPENDIX 2.

\*. DASY5 system calculation Power drift value[dB] =  $20\log(Ea)/(Eb)$  (where, Before SAR testing: Eb[V/m] / After SAR testing: Ea[V/m])

```
Limit of power drift[W] = \pm 5\%
Power drift limit (X) [dP] = 10log(P
```

```
Power drift limit (X) [dB] = 10\log(P_drift)=10\log(1.05/1)=10\log(1.05)-10\log(1)=0.21dB
from E-filed relations with power.
S=E×H=E^2/\eta=P/(4×\pi×r^2) (\eta: Space impedance) \rightarrow P=(E^2\times4\times\pi\times r^2)/\eta
```

Therefore, The correlation of power and the E-filed

Power drift limit (X) dB=10log(P\_drift)=10log(E\_drift)^2=20log(E\_drift)

From the above mentioned, the calculated power drift of DASY5 system must be the less than ±0.21dB.

\*. **D**: Antenna separation distance. It is the distance from the EUT antenna inside a platform to the outer surface of platform which an operator may touch.

## \*. Size of platform: round shape, 60 mm (length) × 60 mm (width) × 20 mm (thickness) (\*. excluding wrist band.)

## \*. Consideration for SAR evaluation exemption

# <sup>t</sup>1. It was applied the SAR test procedure "KDB447498 D01 (v06), Clause 6.2. Wrist watch and wrist-worn transmitters", because this platform which has <u>EUT</u> built-in is a wristwatch and the voice command is supported.

#### According to KDB447498 D01 (v06), Clause 6.2. Wrist watch and wrist-worn transmitters;

Transmitters that are built-in within a wrist watch or similar wrist-wom devices typically operate in speaker mode for voice communication, with the device wom on the wrist and positioned next to the mouth. Next to the mouth exposure requires 1-g SAR and the wrist-wom condition requires 10-g extremity SAR. The 10-g extremity and 1-g SAR test exclusions may be applied to the wrist and face exposure conditions. When SAR evaluation is required, next to the mouth use is evaluated with the front of the device positioned at 10 mm from a flat phantom filled with head tissue-equivalent medium. The wrist bands should be strapped together to represent normal use conditions. SAR for wrist exposure is evaluated with the back of the device positioned in direct contact against a flat phantom filled with body tissue-equivalent medium. The wrist bands should be unstrapped and touching the phantom. The space introduced by the watch or wrist bands and the phantom must be representative of actual use conditions; otherwise, if applicable, the neck or a curved head region of the SAM phantom may be used, provided the device positioning and SAR measurement considerations are necessary, a KDB inquiry is also required for the test results to be acceptable; for example, devices with rigid wrist bands or electronic circuitry and/or antenna(s) incorporated in the wrist bands. These test configurations are applicable only to devices that are worn on the wrist and cannot support other use conditions; therefore, the operating restrictions must be fully demonstrated in both the test reports and user manuals.

\*2. SAR test exclusion considerations according to KDB447498 D01

Step 1) The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by:

- $[(\max, power of channel, including tune-up tolerance, mW)/(min.test separation distance, mm)] \times [\sqrt{f(GHz)}] \le 3.0$  (for SAR(1g)), 7.5(for SAR(10g)) ···· formula (1) If power is calculated from the upper formula (1);
- $[SAR(1g) test exclusion thresholds, mW] = 3 \times [test separation distance, mm] / [\sqrt{f(GHz)]} \cdots formula (2)$
- 1. The upper frequency of the frequency band was used in order to calculate standalone SAR test exclusion considerations.
- 2. Power and distance are rounded to the nearest mW and mm before calculation
- 3. The result is rounded to one decimal place for comparison
- 4. The test exclusions are applicable only when the minimum test separation distance is  $\leq$  50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance of 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.

When the calculated threshold value by a numerical formula above-mentioned in the following table is 3.0 (or less) for SAR 1g (next-to-mouth), nor 7.5 (of less) for SAR 10g (wrist-touch), SAR test can be excluded.

#### <Conclusion for consideration for SAR test reduction>

 Tested platform is a wristwatch with the watch-wristband which can't be removed easily. This platform is usually worn on the wrist. Since the platform has sound responsive function, the platform is used in front of the mouth when a voice input is operated.

2) So, the "Back" setup is considered extremity (wrist) SAR (touch) and is applied the SAR test in body-liquid.

3) So, the 'Front' setup is considered partial body SAR (next-to-mouth, 10 mm separation gap) and is applied the SAR test in head-liquid.

By the determined test setup shown above, the SAR test was applied in the following procedures.

_		
	Stan 1	Worst extremity SAR(10g) (wrist) search of DSSS mode;
	Step I	Determine the highest reported SAR(10g) of DSSS mode. (*. Change the channel and mode, if it is necessary.)
	Step 2	Worst partial body SAR(1g) (next-to-mouth) search of DSSS mode;
	-	Determine the highest reported SAR(1g) of DSSS mode. (*. Change the channel and mode, if it is necessary.)

\*. During SAR test, the radiated power is always monitored by Spectrum Analyzer.

Notes: \*. Gap: It is the separation distance between the outer surface of product and the bottom outer surface of phantom; Max.: Maximum; Meas.: Measured value; n/a: not applied; b: IEEE 802.11b; n/a: not applied.

\*. During test, the platform was operated by build-in rechargeable Li-ion battery with USB bus power by connecting I/F cable.

\*. Calibration frequency of the SAR measurement probe (and used conversion factors)

	Liquid	SAR test frequency	Probe calibration frequency	Validity	Conversion factor	Uncertainty					
	Body	2412, 2437, 2462 MHz	2450MHz	within ±50MHz of calibration frequency	7.32	±12.0%					
	Head	2412, 2437, 2462 MHz	2450MHz	within ±50MHz of calibration frequency	7.31	±12.0%					
* 1	The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band										

\*a. The target value is a parameter defined in Appendix A of KDB 865664 D01 (v01r04), the dielectric parameters suggested are given at 2000, 2450, 3000MHz. Parameters for the frequencies between 2000 and 3000 MHz were obtained using linear interpolation.

 $\Delta SAR(1g) = Cer \times \Delta er + C\sigma \times \Delta \sigma, Cer - 7.854E 4 \times r^3 + 9.402E - 3 \times r^2 - 2.742E - 2 \times f 0.2026 / C\sigma = 9.804E - 3 \times r^3 - 8.661E - 2 \times r^2 + 2.981E - 2 \times f + 0.7829 / 2.742E - 2 \times r^2 + 2.981E - 2.981E$ \*b. Calculating formula:

Since the calculated  $\Delta$ SAR values of the tested liquid had shown positive correction, the measured SAR was not converted by  $\Delta$ SAR correction. \*с.

Calculating formula:  $\Delta$ SAR corrected SAR (W/kg) = (Meas. SAR (W/kg)) × (100 - ( $\Delta$ SAR(%)) / 100 \*d. Calculating formula: Reported SAR (W/kg) = (Measured SAR (W/kg))  $\times$  (Duty scaled)  $\times$  (Tune-up factor)

Duty scaled = Duty scaled factor: Duty cycle correction factor for obtained SAR value, Duty scaled factor [-] = 100(%)/(duty cycle, %) Tune-up factor: Power tune-up factor for obtained SAR value, Tune-up factor [-] =  $1/(10^{(Deviation from max., dB''/10)})$ 

#### (Clause 5.2, 2.4GHz SAR Procedures, in KDB248227 D01 (v02r02))

#### 5.2.1 802.11b DSSS SAR Test Requirements

SAR is measured for 2.4 GHz 802.11b DSSS using either a fixed test position or, when applicable, the initial test position procedure. SAR test reduction is determined according to the following:

When the reported SAR of the highest measured maximum output power channel for the exposure configuration is  $\leq 0.8$  W/kg, no further SAR testing is required for 1) 802.11b DSSS in that exposure configuration.

5.2.2 2.4 GHz 802.11g/n OFDM SAR Test Exclusion Requirements

When SAR measurement is required for 2.4 GHz 802.11g/n OFDM configurations, the measurement and test reduction procedures for OFDM are applied (section 5.3, including sub-sections). SAR is not required for the following 2.4 GHz OFDM conditions.

When KDB Publication 447498 SAR test exclusion applies to the OFDM configuration. 1)

When the highest reported SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is  $\leq$  1.2 W/kg. 2)

SAR test of OFDM mode was reduced, because the estimate reported SAR of OFDM mode was  $\leq 1.2$  W/kg by using the highest reported SAR of DSSS mode.
