1.7. Uncertainty

Uncertainties have been calculated according to the DEKRA internal document.

The reported expanded uncertainties are based on a standard uncertainty multiplied by a coverage factor of k=2, providing a level of confidence of approximately 95%.

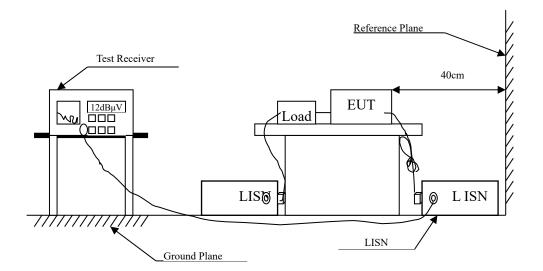

Measurement uncertainties evaluated for each testing system and associated connections are given here to provide the system information for reference. Compliance determinations do not take into account measurement uncertainties for each testing system, but are based on the results of the compliance measurement.

| Test Item | Uncertainty |
|--------------------|-------------------------|
| Conducted Emission | ±3.50 dB |
| | 9 kHz~30 MHz: ±3.88 dB |
| | 30 MHz~1 GHz: ±4.42 dB |
| Radiated Emission | 1 GHz~18 GHz: ±4.28 dB |
| | 18 GHz~40 GHz: ±3.90 dB |

2. Conducted Emission

2.1. Test Setup

2.2. Limits

| FCC Part 15 Subpart B Paragraph 15.107 (dBμV) Limit | | | |
|---|-------|--------|--|
| Frequency | Li | Limits | |
| MHz | QP | AV | |
| 0.15 - 0.50 | 66-56 | 56-46 | |
| 0.50-5.0 | 56 | 46 | |
| 5.0 - 30 | 60 | 50 | |

Remarks: In the above table, the tighter limit applies at the band edges.

2.3. Test Procedure

The EUT and simulators are connected to the main power through a line impedance stabilization network (L.I.S.N.). This provides a 50 ohm /50uH coupling impedance for the measuring equipment. The peripheral devices are also connected to the main power through a LISN that provides a 50ohm /50uH coupling impedance with 50ohm termination. (Please refers to the block diagram of the test setup and photographs.)

Both sides of A.C. line are checked for maximum conducted interference. In order to find the maximum emission, the relative positions of equipment and all of the interface cables must be changed according to ANSI C63.4: 2014 on conducted measurement.

Conducted emissions were invested over the frequency range from 0.15MHz to 30MHz using a receiver bandwidth of 9kHz.

2.4. Test Result of Conducted Emission

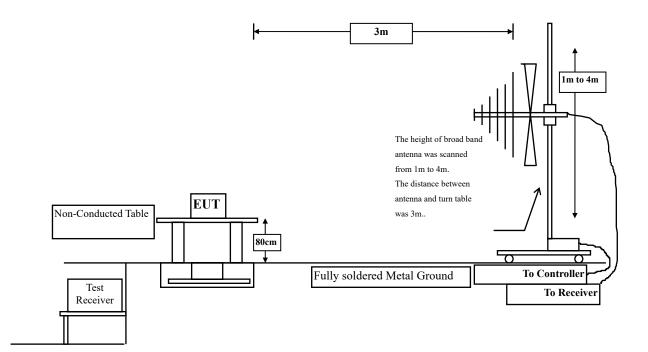

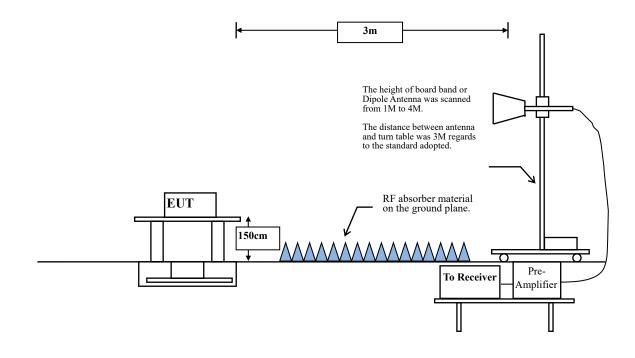

3. Radiated Emission

3.1. Test Setup

Radiated Emission Below 1GHz

Radiated Emission Above 1GHz

| FCC Part 15 Subpart B Paragraph 15.109 Limits | | | |
|---|----------|------------|--|
| Frequency MHz | μV/m @3m | dBµV /m@3m | |
| 30-88 | 100 | 40 | |
| 88-216 | 150 | 43.5 | |
| 216-960 | 200 | 46 | |
| Above 960 | 500 | 54 | |

3.2. Limits

Remarks: 1. RF Voltage ($dB\mu V$) = 20 log RF Voltage (μV)

2. In the Above Table, the tighter limit applies at the band edges.

3. Distance refers to the distance in meters between the measuring instrument antenna and the closed point of any part of the device or system.

3.3. Test Procedure

Measuring the frequency range below 1GHz, the EUT is placed on a turn table which is 0.8 meter above ground, when measuring the frequency range above 1GHz, the EUT is placed on a turn table which is 1.5 meter above ground.

The turn table can rotate 360 degrees to determine the position of the maximum emission level. The EUT was positioned such that the distance from antenna to the EUT was 3 meters.

The antenna can move up and down between 1 meter and 4 meters to find out the maximum emission level.

Both horizontal and vertical polarization of the antenna are set on measurement. In order to find the maximum emission, all of the interface cables must be manipulated according to ANSI C63.10: 2013 on radiated measurement.

The resolution bandwidth below 1GHz setting on the field strength meter is 120 kHz and above 1GHz is 1MHz. Radiated emission measurements below 1GHz are made using broadband Bilog antenna and above 1GHz are made using Horn Antennas.

The measurement is divided into the Preliminary Measurement and the Final Measurement.

The suspected frequencies are searched for in Preliminary Measurement with the measurement antenna kept pointed at the source of the emission both in azimuth and elevation, with the polarization of the antenna oriented for maximum response. The antenna is pointed at an angle towards the source of the emission, and the EUT is rotated in both height and polarization to maximize the measured emission. The emission is kept within the illumination area of the 3 dB bandwidth of the antenna. The measurement frequency range form 30MHz - 10th Harmonic of fundamental was investigated.
