Compliance Certification Services, Inc. (UL CCS) tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL CCS based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

Note: The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL CCS and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL CCS will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, any agency of the Federal Government, or any agency of any government (NIST Handbook 150, Annex A). This report is written to support regulatory compliance of the applicable standards stated above.

2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with FCC OET Bulletin 65 Supplement C 01-01, IEEE STD 1528: 2003, IC RSS 102 Issue 4 and the following specific FCC Test Procedures.

- KDB 248227 D01 SAR Measurement Procedure for 802 11abg v01r02
- KDB 941225 D01 SAR test for 3G devices v02
- KDB 447498 D01 Mobile Portable RF Exposure v04
- KDB 616217 D03 SAR Supp Note and Netbook Laptop v01
- Power Reduction by Sensing (Oct. 2010 TCBC Workshop SAR Updates)

3. FACILITIES AND ACCREDITATION

The test sites and measurement facilities used to collect data are located at 47173 Benicia Street, Fremont, California, USA.

UL CCS is accredited by NVLAP, Laboratory Code 200065-0. The full scope of accreditation can be viewed at http://www.ccsemc.com.

4. CALIBRATION AND UNCERTAINTY

4.1. MEASURING INSTRUMENT CALIBRATION

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

***Note:** Per KDB 450824 D02 requirements for dipole calibration, UL CCS has adopted two years calibration intervals. On annual basis, each measurement dipole has been evaluated and is in compliance with the following criteria:

1. There is no physical damage on the dipole
2. System validation with specific dipole is within 10% of calibrated value.
3. Return-loss is within 20% of calibrated measurement (Appendix 3 , 4 & 6)
4. Impedance is within 5Ω of calibrated measurement (Appendix 3, 4 & 6)

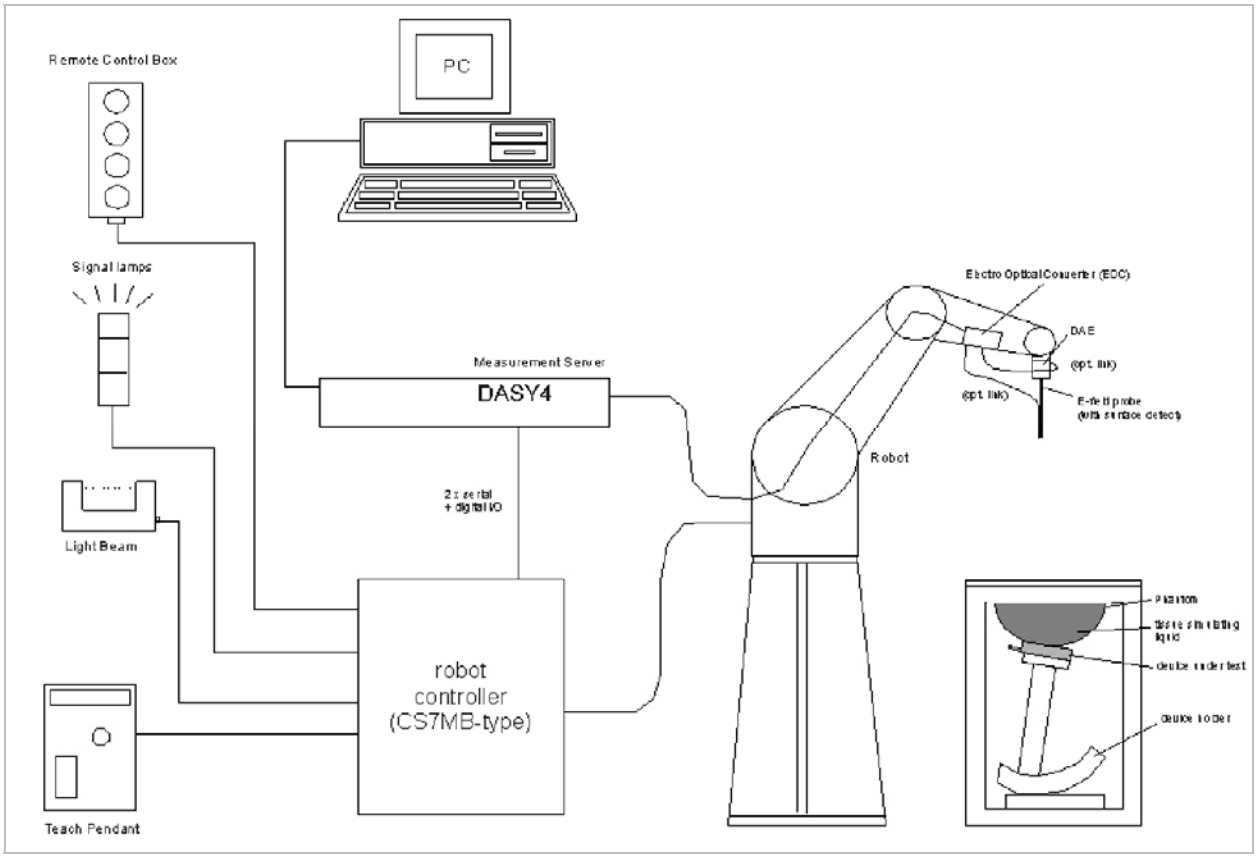
5. EQUIPMENT UNDER TEST

The Apple iPad, Model A1397 is a tablet device with iPod functions (music, application support, and video), 802.11a/b/g/n radio, Bluetooth radio functions, and cellular using the CDMA data radio functions	
Normal operation:	Tablet bottom face, and Tablet edges - Multiple display orientations supporting both portrait and landscape configurations
Antenna tested:	Antenna / Apple part number WiFi/BT / 631-1482 (shared with BT) WWAN / 631-1781
Antenna-to-antenna/user separation distances:	Refer to Sec. 14 for details of antenna locations and separation distances.
Simultaneous transmission:	• WWAN (CDMA) can transmit simultaneously with WiFi/BT • WWAN (CDMA) can transmit simultaneously with Bluetooth • WiFi 2.4 GHz cannot transmit simultaneously with Bluetooth • WiFi 5 GHz bands can transmit simultaneously with Bluetooth
Assessment for SAR evaluation for Simultaneous transmission:	Refer to Sec. 12 for details of KDB 447498 Simultaneous Transmission SAR Evaluations.
Proximity Sensor for Power Reduction	Trigger Distance : 0-10 mm from back surface; 0- 9.5 mm from Top edge / Secondary Portrait of device

6. SYSTEM SPECIFICATIONS



The DASY4 system for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot (Stäubli RX family) with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- A dosimetric probe, i.e., an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with an optical surface detector system.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- A probe alignment unit which improves the (absolute) accuracy of the probe positioning.
- A computer operating Windows 2000 or Windows XP.
- DASY4 software.
- Remote controls with teach pendant and additional circuitry for robot safety such as warning lamps, etc.
- The SAM twin phantom enabling testing left-hand and right-hand usage.
- The device holder for handheld mobile phones.
- Tissue simulating liquid mixed according to the given recipes.
- Validation dipole kits allowing validating the proper functioning of the system.

7. COMPOSITION OF INGREDIENTS FOR TISSUE SIMULATING LIQUIDS

The following tissue formulations are provided for reference only as some of the parameters have not been thoroughly verified. The composition of ingredients may be modified accordingly to achieve the desired target tissue parameters required for routine SAR evaluation.

Simulating Liquids for 5 GHz, Manufactured by SPEAG

Ingredients	(% by weight)
Water	78
Mineral oil	11
Emulsifiers	9
Additives and Salt	2

8. LIQUID PARAMETERS

The simulating liquids should be checked at the beginning of a series of SAR measurements to determine of the dielectric parameters are within the tolerances of the specified target values. For frequencies in 300 MHz to just under 2 GHz, the measured conductivity and relative permittivity should be within ± 5% of the target values. For frequencies in the range of 2–3 GHz and above the measured conductivity should be within ± 5% of the target values. The measured relative permittivity tolerance can be relaxed to no more than ± 10%.

Reference Values of Tissue Dielectric Parameters for Head & Body Phantom
The body tissue parameters that have not been specified in P1528 are derived from the tissue dielectric parameters computed from the 4-Cole-Cole equations and extrapolated according to the head parameters specified in IEEE Standard 1528.

Target Frequency (MHz)	Head		Body

(ε_r = relative permittivity, σ = conductivity and ρ = 1000 kg/m^3)

Reference Values of Tissue Dielectric Parameters for Body Phantom (for 3000 MHz – 5800 MHz)
In the current guidelines and draft standards for compliance testing of mobile phones (i.e., IEEE P1528, OET 65 Supplement C), the dielectric parameters suggested for head and body tissue simulating liquid are given only at 3.0 GHz and 5.8 GHz. As an intermediate solution, dielectric parameters for the frequencies between 5 to 5.8 GHz were obtained using linear interpolation (see table below).

SPEAG has developed suitable head and body tissue simulating liquids consisting of the following ingredients: de-ionized water, salt and a special composition including mineral oil and an emulgators. Dielectric parameters of these liquids were measured suing a HP 8570C Dielectric Probe Kit in conjunction with HP 8753ES Network Analyzer (30 kHz – 6G Hz). The differences with respect to the interpolated values were well within the desired ±5% for the whole 5 to 5.8 GHz range.

9. SYSTEM VERIFICATION

The system performance check is performed prior to any usage of the system in order to verify SAR system measurement accuracy. The system performance check verifies that the system operates within its specifications of ±10%.

System Performance Check Measurement Conditions

- The measurements were performed in the flat section of the SAM twin phantom filled with Head or Body simulating liquid of the following parameters.
- The DASY4 system with an Isotropic E-Field Probe EX3DV3 SN3531 was used for the measurements.
- The dipole was mounted on the small tripod so that the dipole feed point was positioned below the center marking of the flat phantom section and the dipole was oriented parallel to the body axis (the long side of the phantom). The standard measuring distance was 10 mm (above 1 GHz) and 15 mm (below 1 GHz) from dipole center to the simulating liquid surface.
- The coarse grid with a grid spacing of 15 mm was aligned with the dipole.
  For 5 GHz band - The coarse grid with a grid spacing of 10 mm was aligned with the dipole.
- Special 7x7x7 fine cube was chosen for cube
- Distance between probe sensors and phantom surface was set to 3 mm.
  For 5 GHz band - Distance between probe sensors and phantom surface was set to 2.5 mm
- The dipole input power (forward power) was 100 mW
- The results are normalized to 1 W input power.

***Note:** Per KDB 450824 D02 requirements for dipole calibration, UL CCS has adopted two years calibration intervals. On annual basis, each measurement dipole has been evaluated and is in compliance with the following criteria:

1. There is no physical damage on the dipole
2. System validation with specific dipole is within 10% of calibrated value.
3. Return-loss is within 20% of calibrated measurement (Appendix 3, 4 & 6)
4. Impedance is within 5Ω of calibrated measurement (Appendix 3, 4 & 6)

10. SAR MEASUREMENT PROCEDURES

Step 1: Power Reference Measurement
The Power Reference Measurement and Power Drift Measurements are for monitoring the power drift of the device under test in the batch process. The Minimum distance of probe sensors to surface determines the closest measurement point to phantom surface. The minimum distance of probe sensors to surface is 2.1 mm. This distance cannot be smaller than the Distance of sensor calibration points to probe tip as defined in the probe properties (for example, 1.2 mm for an EX3DV3 probe type).

Step 2: Area Scan
The Area Scan is used as a fast scan in two dimensions to find the area of high field values, before doing a fine measurement around the hot spot. The sophisticated interpolation routines implemented in DASY4 software can find the maximum locations even in relatively coarse grids. When an Area Scan has measured all reachable points, it computes the field maximal found in the scanned area, within a range of the global maximum. The range (in dB) is specified in the standards for compliance testing. For example, a 2 dB range is required in IEEE Standard 1528, EN 50361 and IEC 62209 standards, whereby 3 dB is a requirement when compliance is assessed in accordance with the ARIB standard (Japan). If only one Zoom Scan follows the Area Scan, then only the absolute maximum will be taken as reference. For cases where multiple maximums are detected, the number of Zoom Scans has to be increased accordingly.

Step 3: Zoom Scan
Zoom Scans are used to assess the peak spatial SAR values within a cubic averaging volume containing 1 g and 10 g of simulated tissue. The Zoom Scan measures ≥ 7 x 7 x 9 points within a cube whose base faces are centered on the maxima found in a preceding area scan job within the same procedure. When the measurement is done, the Zoom Scan evaluates the averaged SAR for 1 g and 10 g and displays these values next to the job's label.

Step 4: Power drift measurement
The Power Drift Measurement measures the field at the same location as the most recent power reference measurement within the same procedure, and with the same settings. The Power Drift Measurement gives the field difference in dB from the reading conducted within the last Power Reference Measurement. This allows a user to monitor the power drift of the device under test within a batch process. The measurement procedure is the same as Step 1.

Step 5: Z-Scan
The Z Scan measures points along a vertical straight line. The line runs along the Z-axis of a one-dimensional grid. In order to get a reasonable extrapolation, the extrapolated distance should not be larger than the step size in Z-direction.

SAR Testing Considerations & FCC KDB 335737 Inquiries

11.1. iPad Back Surface SAR Testing Distance

For the iPad Back Surface general composite testing (with back-off disabled), a distance of 10mm from the body phantom was chosen for the transmitting modes of the device. These test conditions were based on the form factor, size, operational configurations, exposure conditions, and display orientations.

11.2. iPad Top Edge Secondary Portrait SAR Testing Distance

For the iPad Top Edge Secondary Portrait a composite and conservative test (with back-off disabled), separation distance of 9.5mm from the body phantom was determined to be applicable for the top edge based on the form factor, size, operational configurations, exposure conditions, and display orientations.

11.3. iPad WIFI Exclusions for SAR Testing

The iPad does not have proximity sensors or back-off capabilities on WiFi.

11.4. Additional SAR Testing for the Back Surface and Top Edge

Based on discussions with the FCC it was determined that additional SAR testing is required. The additional testing required testing at a conservative distance from the iPad with the power back-off disabled via special development software. Details about the proximity sensor operation, and special development software are included in a separate document titled “Operational Description”.

Proximity Sensor Status Table – Back Surface In Conservative Proximity Sensor Operation

Distance to Back Surface of iPad (mm)	8.0	9.0	10.0	11.0	12.0	13.0	14.0	15.0
Proximity Sensor Status	ON	ON	ON	OFF	OFF	OFF	OFF	OFF

Proximity Sensor Status Table –Top Edge Secondary Portrait In Conservative Proximity Sensor Operation

Distance to Top Edge of iPad (mm)	8.5	9.5	10.5	11.5	12.5	13.5	14.5	15.5
Proximity Sensor Status	ON	ON	OFF	OFF	OFF	OFF	OFF	OFF

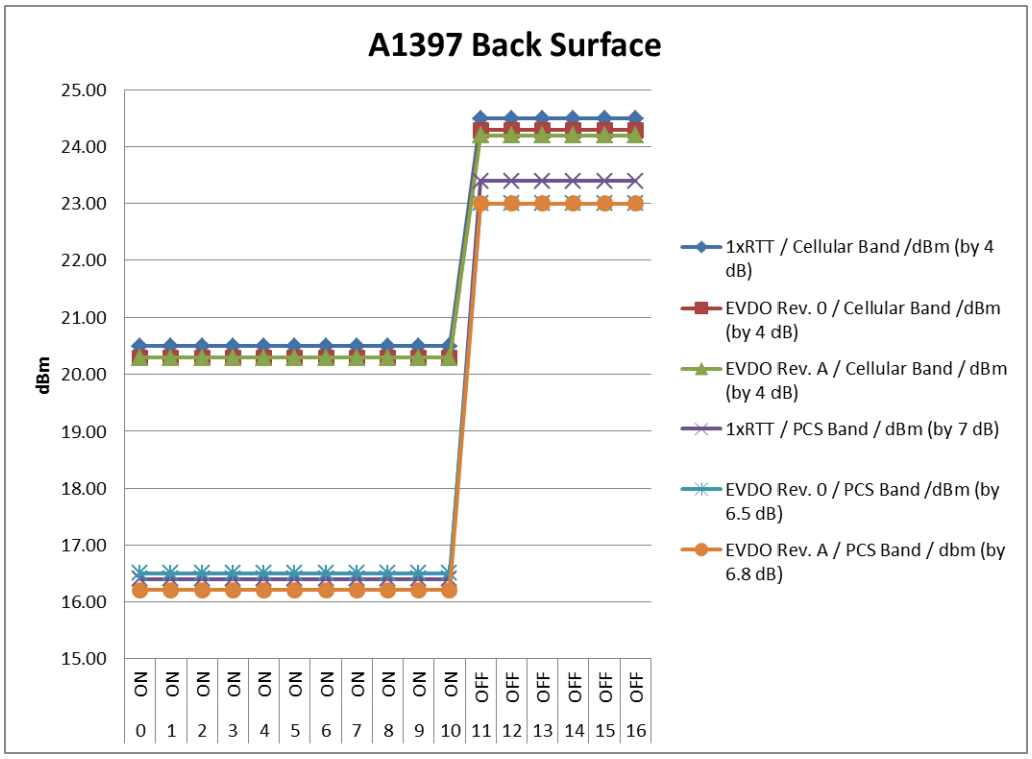
11.5. Method of SAR Measurement With and Without Back-off Enabled

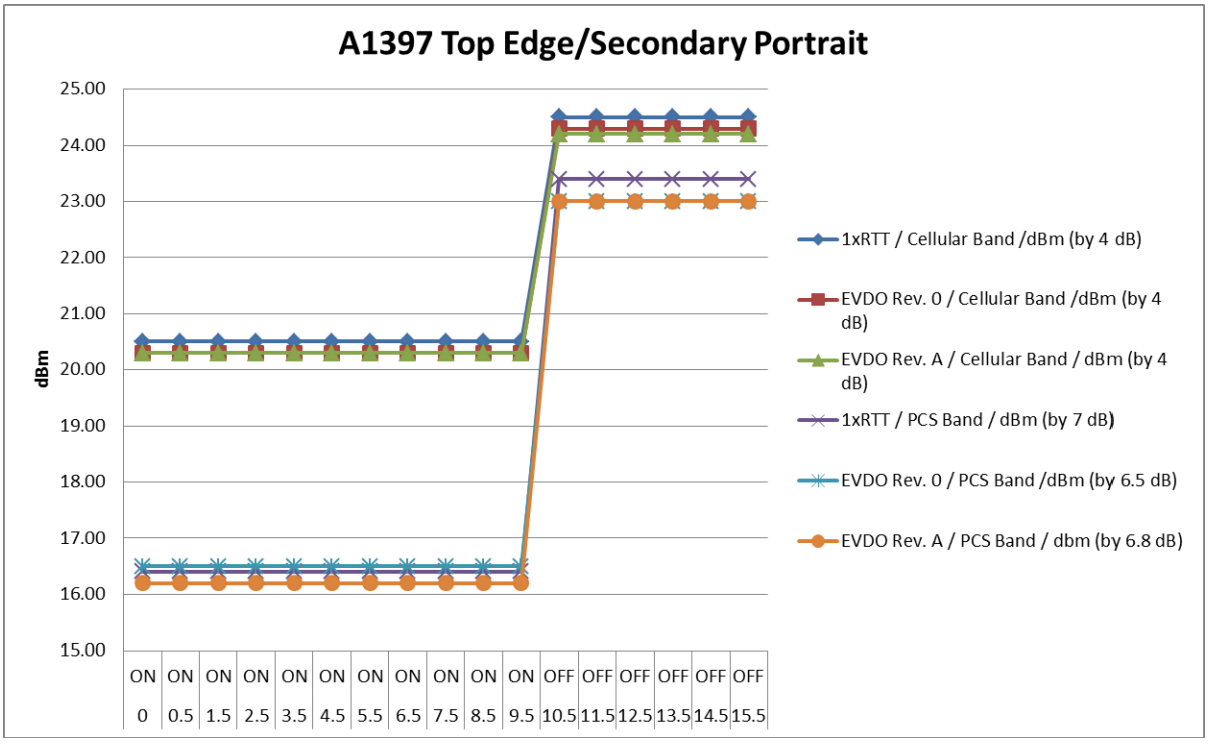
Based on the above proximity sensor activation vs. distance results, the iPad was tested at zero spacing, back-off enabled and additionally at a conservative test distance of 9.5 mm on the top edge and 10 mm on back surface with back-off disabled (maximum power).

To test SAR with back-off enabled at zero spacing, the iPad was placed in maximum power transmit mode (with back-off enabled) with a base station simulator. The device was then positioned under the tissue equivalent liquid-filled flat phantom at zero distance.

To test SAR with back-off disabled at 9.5 mm, the iPad utilized special development software. The ability to disable the back-off is not available in the production release of software. The device was placed in maximum power transmit mode with a base station simulator. The iPad was then positioned under the tissue equivalent liquid-filled flat phantom at a distance of 9.5mm when in the “Top Edge – Secondary Portrait” orientation and at 10mm when in “Tablet Mode-Back surface” and tested with the back-off disabled.

(Please refer to Cetecom SAR Test Report No: SAR_ APPLE_070_FCC for SAR evaluation at Back Surface with 10 mm distance and Top Edge/ Secondary Portrait with 9.5 mm with special development software to disable power back-off))





12. RF OUTPUT POWER VERIFICATION

Maximum output power is verified on the Low, Middle and High channels according to procedures in section 4.4.5.2 of 3GPP2 C.S0011/TIA-98-E for 1xRTT, section 3.1.2.3.4 of 3GPP2 C.S0033-0/TIA-866 for Rel. 0 and section 4.3.4 of 3GPP2 C.S0033-A for Rev. A

***Note:** WWAN antenna is located at Top edge (Secondary portrait); antenna-to-bottom edge distance is more than 20 cm. Therefore primary portrait is excluded from SAR evaluation for WWAN. At the secondary Portrait / Top Edge mode, WiFi is more than 20 cm to the flat phantom which are excluded from SAR evaluation. Back Surface and Secondary Portrait/Top with special development software with 10 mm / 9.5 mm WWAN test data are obtained from Cetecom SAR test report submitted separately.

CONCLUSIONS:

WWAN (CDMA) and WiFi (2.4 GHz & 5 GHz bands):
Simultaneous transmission is SAR not required for WWAN (CDMA) & WiFi because the sum of the 1-g SA is < 1.6 W/kg.

WWAN (CDMA) and Bluetooth:
Simultaneous transmission is SAR not required for WWAN (CDMA) & Bluetooth because stand alone SAR is not required for Bluetooth (output power is ≤ 60/f(GHz) mW).

WiFi 5GHz bands and Bluetooth:
Simultaneous transmission is SAR not required for WiFi 5GHz bands & Bluetooth because stand alone SAR is not required for Bluetooth (output power is ≤ 60/f(GHz) mW).
