UL Verification Services Ltd. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL Verification Services Ltd. based on interpretations and/or observations of test results. Measurement Uncertainties are in accordance with the above standard and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.					
<b>Note:</b> The results documented in this report apply only to the tested sample(s), under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL Verification Services Ltd. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL Verification Services Ltd. will constitute fraud and shall nullify the document. ## **2. Test Specification, Methods and Procedures**

### **2.1. Test Specification**

<b>Reference:</b>	KDB Publication Number: 865664 D01 SAR Measurement 100 MHz to 6 GHz v01r04
<b>Title:</b>	SAR Measurement Requirements for 100 MHz to 6 GHz
<b>Introduction:</b>	The SAR Measurement procedures for 100MHz to 6GHz are described in this document. Field probes, tissue dielectric properties, SAR scans, measurement accuracy and variability of the measured results are discussed. The field probe and SAR scan requirements are derived from criteria considered in standard IEEE 1528-2013. The wireless product and technology specific procedures in applicable KDB publications are required to be used unless further guidance has been approved by the FCC.
<b>Purpose of Test:</b>	To determine if the Equipment Under Test complies with the Specific Absorption Rate for general population/uncontrolled exposure limit of 1.6 W/kg as specified in FCC 47 CFR part 2 (2.1093).

### **2.2. Methods and Procedures Reference Documentation**

The methods and procedures used were as detailed in:

#### **IEEE 1528:2013**

IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communication Devices: Measurement Techniques.

#### **FCC KDB Publication:**

### **2.3. Definition of Measurement Equipment**

The measurement equipment used complied with the requirements of the standards referenced in the methods & procedures section above. Section 4.3 contains a list of the test equipment used.

### **3. Facilities and Accreditation**

The test sites and measurement facilities used to collect data are located at

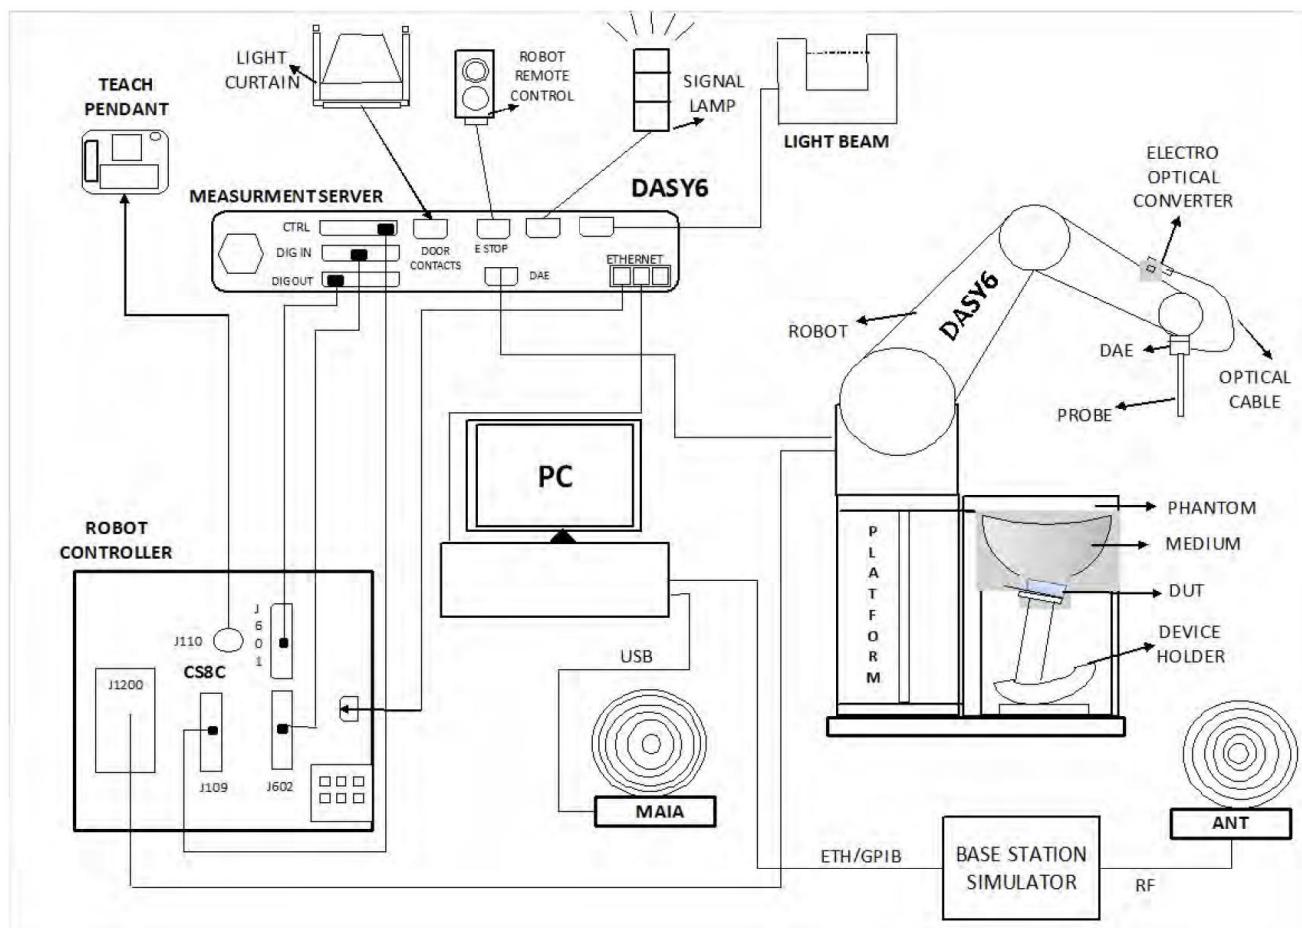

Horizon Unit 1-3, Wade Road, Kingsland Business Park, Basingstoke, Hampshire, RG24 8AH, UK	Facility Type
SAR Lab 60	Controlled Environment Chamber
SAR Lab 61	Controlled Environment Chamber

UL Verification Services Ltd, is accredited by UKAS (United Kingdom Accreditation Service), Laboratory UKAS Code 0644.

## 4. SAR Measurement System & Test Equipment

### 4.1. SAR Measurement System

The DASY system used for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic Field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running Win 8.1 or Win 10 and the DASY software.
- Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

## 4.2. SAR Measurement Procedure

### 4.2.1. Normal SAR Measurement Procedure

The following procedure shall be performed for each of the test conditions Measure the local SAR at a test point within 8 mm of the phantom inner surface that is closest to the DUT.

- a) Measure the two-dimensional SAR distribution within the phantom (area scan procedure).
- b) The boundary of the measurement area shall not be closer than 20 mm from the phantom side walls. The distance between the measurement points should enable the detection of the location of local maximum with an accuracy of better than half the linear dimension of the tissue cube after interpolation. A maximum grid spacing of 20 mm for frequencies below 3 GHz and  $(60/f \text{ [GHz]}) \text{ mm}$  for frequencies of 3 GHz and greater is recommended. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and  $\delta \ln(2)/2 \text{ mm}$  for frequencies of 3 GHz and greater, where  $\delta$  is the plane wave skin depth and  $\ln(x)$  is the natural logarithm. The maximum variation of the sensor-phantom surface distance shall be  $\pm 1 \text{ mm}$  for frequencies below 3 GHz and  $\pm 0,5 \text{ mm}$  for frequencies of 3 GHz and greater. At all measurement points the angle of the probe with respect to the line normal to the surface should be less than  $5^\circ$ . If this cannot be achieved for a measurement distance to the phantom inner surface shorter than the probe diameter, additional uncertainty evaluation is needed.
- c) From the scanned SAR distribution, identify the position of the maximum SAR value, in addition identify the positions of any local maxima with SAR values within 2 dB of the maximum value that will not be within the zoom scan of other peaks; additional peaks shall be measured only when the primary peak is within 2 dB of the SAR compliance limit (e.g., 1 W/kg for 1,6 W /kg 1 g limit, or 1,26 W/kg for 2 W /kg, 10 g limit).
- d) Measure the three-dimensional SAR distribution at the local maxima locations identified in step c) (zoom scan procedure). The horizontal grid step shall be  $(24 / f \text{ [GHz]}) \text{ mm}$  or less but not more than 8 mm. The minimum zoom scan size is 30 mm by 30 mm by 30 mm for frequencies below 3 GHz. For higher frequencies, the minimum zoom scan size can be reduced to 22 mm by 22 mm by 22 mm. The grid step in the vertical direction shall be  $(8-f \text{ [GHz]}) \text{ mm}$  or less but not more than 5 mm, if uniform spacing is used. If variable spacing is used in the vertical direction, the maximum spacing between the two closest measured points to the phantom shell shall be  $(12/f \text{ [GHz]}) \text{ mm}$  or less but not more than 4 mm, and the spacing between farther points shall increase by an incremental factor not exceeding 1,5. When variable spacing is used, extrapolation routines shall be tested with the same spacing as used in measurements. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and  $\delta \ln(2)/2 \text{ mm}$  for frequencies of 3 GHz and greater, where  $\delta$  is the plane wave skin depth and  $\ln(x)$  is the natural logarithm. Separate grids shall be centred on each of the local SAR maxima found in step c). Uncertainties due to field distortion between the media boundary and the dielectric enclosure of the probe should also be minimized, which is achieved if the distance between the phantom surface and physical tip of the probe is larger than probe tip diameter. Other methods may utilize correction procedures for these boundary effects that enable high precision measurements closer than half the probe diameter. For all measurement points, the angle of the probe with respect to the flat phantom surface shall be less than  $5^\circ$ .
- e) Use post processing (e.g. interpolation and extrapolation) procedures to determine the local SAR values at the spatial resolution needed for mass averaging.
- f) The local SAR should be measured at the same location as in Step a). SAR drift is assessed and reported in the uncertainty budget.

In the event that the evaluation of measurement drift exceeds the 5 % tolerance, it is required that SAR be reassessed following guidelines contained within this standard.

If the drift is larger than 5 %, then the measurement drift shall be considered a bias, not an uncertainty.

A correction shall be applied to the measured SAR value. It is not necessary to record the drift in the uncertainty budget (i.e.  $ui = 0\%$ ). The uncertainty budget reported in a measurement report should correspond to the highest SAR value reported (after correction, if applicable). Alternatively, the uncertainty budget reported should cover all measurements, i.e., it should report a conservative value.

## **5. Measurement Uncertainty**

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently, the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor, such that a confidence level of approximately 95% is maintained. For the purposes of this document “approximately” is interpreted as meaning “effectively” or “for most practical purposes”.

Test Name	Confidence Level	Calculated Uncertainty
Uncertainty- Freq. < 3 GHz Head & Body Configuration 1g	95%	$\pm 28.54\%$
Uncertainty- Freq. > 3 GHz Body & Body Configuration 1g	95%	$\pm 26.64\%$

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty, the published guidance of the appropriate accreditation body is followed.

## **6. Device Under Test (DUT) Information**

### **6.1. DUT Description**

<b>DUT Description:</b>	The device under test is a laptop with WLAN 2.4 GHz (802.11 b/g/n) with MIMO 3x3, WLAN 5.0 GHz {802.11a/n (HT20, HT40), 802.11ac (VHT20, VHT40, VHT80)} with MIMO 3x3 and <i>Bluetooth</i> (BDR, EDR and BLE).	
<b>Serial Number:</b>	<b>Radiated Samples</b>	C02ZH00EP1YX C02ZG00JP22J
	<b>Conducted Sample</b>	C02ZH00EP1YX C02ZG00JP22J
<b>Hardware Version Number:</b>	Rev 1	
<b>Firmware WLAN):</b>	9.30.318.2	
<b>Firmware (BT):</b>	44	
<b>Country of Manufacture:</b>	China	
<b>Device dimension</b>	304.1 x 212.4 x 14.7 mm (Length x Width x Height)	
<b>Date of Receipt:</b>	02 December 2019	

<b>Antenna Type:</b>	Internal integral	
<b>Antenna Length:</b>	Unknown	
<b>Number of Antenna Positions:</b>	Antenna WF2 (Core 0) - WLAN ~ Wi-Fi 2.4 GHz / 5.0 GHz	1 fixed
	Antenna WF1 (Core 1) - WLAN / WPAN ~ Wi-Fi 2.4 GHz / 5.0 GHz / BT	1 fixed
	Antenna WF3 (Core 2) - WLAN ~ Wi-Fi 2.4 GHz / 5.0 GHz / Auxiliary	1 fixed
<b>Battery Type(s):</b>	Embedded Li-ion

**Note:** The Antenna to edge separation distances are indicated in the 'Antenna Schematics' located in Section 14.1 of this report.

### **7.2. SAR Test Exclusion Consideration**

Frequency Band	Configuration(s)		
	Body		
	SISO	MIMO	
		2x2	3x3
WLAN 2.4 GHz	No	No	No
WLAN 5.2 GHz (U-NII-1)	No	No	No
WLAN 5.3 GHz (U-NII-2A)	Yes <sup>1</sup>	Yes <sup>1</sup>	Yes <sup>1</sup>
WLAN 5.6 GHz (U-NII-2C)	No	No	No
WLAN 5.8 GHz (U-NII-3)	No	No	No
Bluetooth	No	Not Supported	Not Supported

**Note:** As per KDB 248227, U-NII-1 was chosen for SAR evaluation as maximum rated power for U-NII-1 > U-NII-2A. Based on the measurements obtained, SAR measurements on U-NII-2A band are not required as highest reported SAR from U-NII-1 band is ≤ 1.2 W/Kg.

## **8. Conducted Output Power Measurements**

### **8.1. RF Output Average Power Measurement: Wi-Fi 2.4 GHz**

**Note:**

- Additional Conducted power measurements are performed on adjacent Channels having same or higher Max. rated power than the standard Channels (i.e., 1, 6, and 11).

## 8.2. RF Output Average Power Measurement: Wi-Fi 5.0GHz

### Note:

1. When the same transmission mode configurations have the same maximum output power on the same channel for the 802.11a/n/ac modes, the channel in the lower order/sequence 802.11 mode (i.e. a, n then ac) is selected.
2. For the cases where the power are not flat throughout the modes, additional power measurements were also performed on the next highest bandwidth provided the power response was identical. This was performed in order to assess the SAR response throughout the frequency band and established that all worst cases have been evaluated.

### 8.3. RF Output Average Power Measurement: Wi-Fi SDB Mode

Simultaneous Dual Band (SDB) mode allows antenna Core 2 to simultaneously transmit on 2 different bands (2.4GHz and 5GHz) using the same antenna, since this one contains two cores, Main and Auxiliary. One band will transmit using the Main core and the other uses the Auxiliary core.

When this mode is enabled, the Auxiliary core is set to transmit at “SDB Mode Aux Core” standard power rate (Section 6) and the Main core set to transmit at a lower rate.

When the SDB mode is active, Core 2 Auxiliary core can also transmit along with Core 0 and Core 1. For these cases, all the antennas are set to the standard power rate.

## **9. Dielectric Property Measurements & System Check**

### **9.1.Tissue Dielectric Parameters**

The temperature of the tissue-equivalent medium used during measurement must also be within 18°C to 25°C and within  $\pm 2^\circ\text{C}$  of the temperature when the tissue parameters are characterized.

The dielectric parameters must be measured before the tissue-equivalent medium is used in a series of SAR measurements. The parameters should be re-measured after each 3 – 4 days of use; or earlier if the dielectric parameters can become out of tolerance; for example, when the parameters are marginal at the beginning of the measurement series.

Tissue dielectric parameters were measured at the low, middle and high frequency of each operating frequency range of the test device.

These values were linearly interpolated between the values in this table that are immediately above and below these values, except the values at 6000 MHz that were linearly extrapolated from the values at 3000 MHz and 5800 MHz.

## 9.2. System Check

SAR system verification is required to confirm measurement accuracy, according to the tissue dielectric media, probe calibration points and other system operating parameters required for measuring the SAR of a test device. The system verification must be performed for each frequency band and within the valid range of each probe calibration point required for testing the device. The same SAR probe(s) and tissue-equivalent media combinations used with each specific SAR system for system verification must be used for device testing. When multiple probe calibration points are required to cover substantially large transmission bands, independent system verifications are required for each probe calibration point. A system verification must be performed before each series of SAR measurements using the same probe calibration point and tissue-equivalent medium. Additional system verification should be considered according to the conditions of the tissue-equivalent medium and measured tissue dielectric parameters, typically every three to four days when the liquid parameters are re-measured or sooner when marginal liquid parameters are used at the beginning of a series of measurements.

## 9.3. Reference Target SAR Values

The reference SAR values are obtained from the calibration certificate of system validation dipoles. The measured values are normalised to 1 Watt.

## 9.4. Dielectric Property Measurements & System Check Results

The 1-g SAR and 10-g SAR measured with a reference dipole, using the required tissue-equivalent medium at the test frequency, must be within  $\pm 10\%$  of the manufacturer calibrated dipole SAR target. The internal limit is set to  $\pm 10\%$ .

## **10. Measurements, Examinations and Derived Results**

### **10.1. General Comments**

In the 2.4 GHz band, separate SAR procedures were applied to DSSS and OFDM configurations to simplify DSSS test requirements. SAR test was evaluated on the mode with the highest rated power, which is in this case was 802.11b mode. OFDM mode was not evaluated because when the highest reported SAR for DSSS was adjusted by the ratio of OFDM to DSSS specified maximum output power, the adjusted SAR obtained was < 1.2W/kg.

In the 5.0 GHz band, the initial test configuration transmission mode was determined by the 802.11 configuration with the highest maximum output power specified for production units, including upper tune-up tolerance, in each standalone and aggregated frequency band. Since multiple channel bandwidth configuration modes have the same specified maximum output power, SAR test was performed on the largest channel bandwidth with the lowest order modulation.

For the cases where the power was not flat throughout the modes to test, additional runs were also performed on the next highest bandwidth provided the power response was identical. This was performed in order to assess the SAR response throughout the frequency band and established that all worst cases have been evaluated.

#### **Notes:**

1. SAR Values represented by “-” indicate no SAR peaks were detected during area scans.
2. Effective 19th February 2019, the FCC has permitted the use of the head-tissue simulating liquid specified in IEC 62209-1 for all SAR tests – “RF Exposure Procedures” TCB Presentation April 2019.
3. As per KDB 248227, U-NII-1 was chosen for SAR evaluation as maximum rated power for U-NII-1 > U-NII-2A. Based on the measurements obtained, SAR measurements on U-NII-2A band are not required as highest reported SAR from U-NII-1 band is ≤ 1.2 W/Kg.

## 10.5. SAR Measurement Variability

In accordance with published RF Exposure KDB procedure 865664 D01 SAR measurement 100 MHz to 6 GHz. These additional measurements are repeated after the completion of all measurements requiring the same head or body tissue-equivalent medium in a frequency band. The test device should be returned to ambient conditions (normal room temperature) with the battery fully charged before it is re-mounted on the device holder for the repeated measurement(s) to minimize any unexpected variations in the repeated results.

- 1) Repeated measurement is not required when the original highest measured SAR is < 0.80 W/kg; steps 2) through 4) do not apply.
- 2) When the original highest measured SAR is  $\geq 0.80$  W/kg, repeat that measurement once.
- 3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is  $> 1.20$  or when the original or repeated measurement is  $\geq 1.45$  W/kg ( $\sim 10\%$  from the 1-g SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is  $\geq 1.5$  W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is  $> 1.20$ .

**Notes:**

- “Highest Reported Sum-SAR” column contains the highest reported SAR addition (if applicable) of simultaneous transmission technologies being transmitted on the same antenna. The summation only considered for same antenna {i.e.: Core 1 (5.0 GHz Main - SISO) + Core 1 (BT - SISO)}, as the other transmitting antenna (i.e.: Core 0 or Core 2) is > 50 mm separation distance from Core 1 antenna and does not have any effects on SAR from Core 0 or Core 2 antenna.
- On cases 20 – 23 and 32 – 37, when Core 2 (Main) is on MIMO mode, measured SAR level has been considered negligible since Core 2 (Main) is set to transmit at 7 dB less than the standard power rate.
- On cases 17, 18, 20 – 23, 28, 29, 32 – 37 Core 2 Main and Auxiliary cores are transmitting simultaneously.
