General:

The purpose of this report is to show compliance to the FCC regulations for devices operating under Part 27 of the Code of Federal Regulations title 47.

This report informs about the results of the EMC tests, it only refers to the equipment under test. No part of this report may be reproduced in any form, without written permission.

1 Test Results Summary

Name of Test	FCC Para. No.	FCC Method	FCC Spec.	Result
RF Power Output	27.50(b)(c)	2.1046	1000 Watts ERP	Complies
Occupied Bandwidth	2.1049	2.1049	Input/Output	Complies
Spurious Emissions at Antenna Terminals	27.53(c)(d)(g)	2.1051	-13dBm	Complies
Radiated Spurious emission	27.53(m)	2.1053 TIA/EA-603	-13dBm E.I.R.P	Complies
Intermodulation	KDB 935210 D02 v03r02 D.3(i)	KDB 935210 D02 v03r02 D.3(i)	KDB 935210 D02 v03r02 D.3(i)	Complies
*Frequency Stability	27.54	2.1055	Must stay in band	NA
Out of Band Rejection	KDB 935210 D02 v03r02	KDB 935210 D03 v04	KDB 935210 D03 v04	Complies

*Footnotes (Frequency Stability):

(1) Modulation characteristics were not tested since the E.U.T processes but does not produce a modulated waveform.

(2) The equipment under test uses a common oscillator to down-convert the RF input to an intermediate frequency and to up-convert the IF to RF output. The RF input and output frequency are the same.

2 Equipment under test (E.U.T.)

2.1 Description

Kind of equipment	AF 727
Andrew Ident. Number	7577532-01
Serial no.(SN)	02ZCBF625815
Revision	00
Software version and ID	Node AM Software V1.7.6, 7613506-07
Type of modulation and Designator	CDMA (F9W) ☐ W-CDMA (F9W) ☐ LTE (G7D) ☒
Frequency Translation	F1-F1 ☒ F1-F2 ☐ N/A ☐
Band Selection	Software ☒ Duplexer ☒ Full band ☐

2.1.1 Downlink

Pass band	Path 728 MHz – 757 MHz
Pass band under test	Path 728 MHz – 746 MHz Path 746 MHz – 757 MHz
Max. composite output power based on one carrier per path (rated)	27.0 dBm = 0.5 W (LTE)
System Gain*	84 dB

2.1.2 Uplink

Pass band	Path 698 MHz – 716 MHz, 776 MHz - 787MHz
Maximum rated output power	30 dBm = 1 W
System Gain*	84 dB

2.1.3 Description of EUT

The Node A is an RF enhancer which is capable of filtering and amplifying a multitude of distinct sub-bands up to 120 MHz in total anywhere within multiple frequency bands. It is designed to be part of the primary infrastructure.

2.1.4 Block diagram of measurement reference points

figure 2.1.4-#1 Block diagram of measurement reference points

DCM AF 727 is the EUT

Reference point A	UL output,	DL input
Reference point B	DL output,	UL input

3 Test site (Andrew Buchdorf)

3.1 Test environment

All tests were performed under the following environmental conditions:

Condition	Minimum value	Maximum value
Barometric pressure	86 kPa	106 kPa
Temperature	15°C	30°C
Relative Humidity	20 %	75 %
Power supply range	±5% of rated voltages	

3.2 Test equipment Test equipment

CIU = Calibrate in use

3.3 Input and output losses

All recorded power levels should be referenced to the input and output connectors of the repeater, unless explicitly stated otherwise.

The test equipment used in this test has to be calibrated, so that the functionality is also checked.

All cables, attenuators, splitter, isolator, circulator and combiner etc. must be measured before testing and used for compensation during testing.

3.4 Measurement uncertainty

The extended measurement uncertainty corresponds to the measurement results from the standard measurement uncertainty multiplied by the coverage factor $k=2$. The true value is located in the corresponding interval with a probability of 95 %.

4 Test site (Bureau Veritas Consumer Products Services)

FCC Test site: 96997

See relevant dates under section 10 of this test report.

5 RF Power Out: §27.50, §2.1046

figure 5-#1 Test setup: RF Power Out: §27.50, §2.1046

Measurement uncertainty	± 0,38 dB
Test equipment used	9046, 9126, 9784, 7537, 7584, 7542, 8542, 8544, 7370

5.1 Limit

Minimum standard:

Para. No.27.50(b)(4) and (c)(1) and (c) (3)

(b) The following power and antenna height limits apply to transmitters operating in the 746–763 MHz, 775–793 MHz and 805–806 MHz bands:

(4) Fixed and base stations transmitting a signal in the 746–757 MHz, 758–763 MHz, 776–787 MHz, and 788–793 MHz bands with an emission bandwidth greater than 1 MHz must not exceed an ERP of 1000 watts/MHz and an antenna height of 305 m HAAT, except that antenna heights greater than 305 m HAAT are permitted if power levels are reduced below 1000 watts/MHz ERP accordance with Table 3 of this section.

(c) The following power and antenna height requirements apply to stations transmitting in the 698–746 MHz band:

(1) Fixed and base stations transmitting a signal with an emission bandwidth of 1 MHz or less must not exceed an effective radiated power (ERP) of 1000 watts and an antenna height of 305 m height above average terrain (HAAT), except that antenna heights greater than 305 m HAAT are permitted if power levels are reduced below 1000 watts ERP in accordance with Table 1 of this section;

(3) Fixed and base stations transmitting a signal with an emission bandwidth greater than 1 MHz must not exceed an ERP of 1000 watts/MHz and an antenna height of 305 m HAAT, except that antenna heights greater than 305 m HAAT are permitted if power levels are reduced below 1000 watts/MHz ERP in accordance with Table 3 of this section;

5.2 Test method

§ 2.1046 Measurements required: RF power output.

(a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in § 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.

(c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the test conditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations

5.3 Test Results

Detector RMS.

Test signal LTE:

Signal waveform according to Test Model 1.1, E-TM1.1, clause 6.1.1.1-1, table 6.1.1.1-1 of standard specification 3GPP TS 36.141 V9.3.0 (2010-03).

5.3.1 Downlink

Modulation	Measured at	Path	RBW VBW Span	RF Power (dBm)	RF Power (W)	Plot -
LTE	Middle	737 MHz (Band 12 (Band Class 19))	3MHz 10MHz 15MHz	27.0	0.5	5.3.2.2 #1
LTE	Middle	751.5 MHz (Band 13 (Band Class 7))	3MHz 10MHz 15MHz	27.0	0.5	5.3.2.3 #1

table 5.3.1-#1 RF Power Out: §27.50, §2.1046 Test Results Downlink

The max RF Power out is 27 dBm, so the maximum antenna gain (x) can be calculated as follow:

Limit = 1000W (erp) = **60 dBm**

Info: 1000W (erp) = 1640W (eirp)

$60 \text{ dBm} > 27 \text{ dBm} + x \rightarrow x = 60 \text{ dBm} - 27 \text{ dBm} = \underline{33 \text{ dBd}}$

$x \text{ dBi} = 33 \text{ dBd} + 2.15 = \underline{35.15 \text{ dBi}}$

=> The antenna that will be used for the complete system have to have a gain lower than 35.15 dBi, relative to a dipol.

5.3.2 Uplink

Modulation	Measured at	Path	RBW VBW Span	RF Power (dBm)	RF Power (W)	Plot -
LTE	Middle	707.0 MHz (Band 12 (Band Class 19))	3MHz 10MHz 15MHz	30.0	1.0	5.3.2.2 #1
LTE	Middle	781.5 MHz (Band 13 (Band Class 7))	3MHz 10MHz 15MHz	30.0	1.0	5.3.2.3 #1

table 5.3.2-#2 RF Power Out: §27.50, §2.1046 Test Results Uplink

The max RF Power out is 30 dBm, so the maximum antenna gain (x) can be calculated as follow:

Limit = 1000W (erp) = **60 dBm**

Info: 1000W (erp) = 1640W (eirp)

$60 \text{ dBm} > 30 \text{ dBm} + x \rightarrow x = 60 \text{ dBm} - 30 \text{ dBm} = \underline{30 \text{ dBd}}$

$x \text{ dBi} = 30 \text{ dBd} + 2.15 = \underline{32.15 \text{ dBi}}$

=> The antenna that will be used for the complete system have to have a gain lower than 32.15 dBi, relative to a dipol.

5.3.2.1 LTE Downlink

Modulation	Pin / dBm (Ref. point A)
LTE (Band 12 (Band Class 19))	-57.0
LTE (Band 13 (Band Class 7))	-57.0

*measured with 84dB gain

5.4 Summary test result

Test result	complies, according the plots above
Tested by:	F. Bengesser
Date:	01.03.2017

6 Occupied Bandwidth: §2.1049

External Attenuator DL x dB = 20 dB
figure 6-#1 Test setup: Occupied Bandwidth: §2.1049

Measurement uncertainty	± 0,38 dB
Test equipment used	9236, 9123, 9300, 8990, 8668, 8667, 7406,

6.1 Limit

The spectral shape of the output should look similar to input for all modulations.

6.2 Test method

Para. No.2.1049

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable:

7.1 Limit

Minimum standard:

Para. No.27.53 (c), (f) and (g)

(c) For operations in the 746–758 MHz band and the 776–788 MHz band, the power of any emission outside the licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, in accordance with the following:

(1) On any frequency outside the 746–758 MHz band, the power of any emission shall be attenuated outside the band below the transmitter power (P) by at least $43 + 10 \log (P)$ dB;

(3) On all frequencies between 763–775 MHz and 793–805 MHz, by a factor not less than $76 + 10 \log (P)$ dB in a 6.25 kHz band segment, for base and fixed stations;

(f) For operations in the 746–763 MHz, 775–793 MHz, and 805–806 MHz bands, emissions in the band 1559–1610 MHz shall be limited to –70 dBW/MHz equivalent isotropically radiated power (EIRP) for wideband signals, and –80 dBW EIRP for discrete emissions of less than 700 Hz bandwidth. For the purpose of equipment authorization, a transmitter shall be tested with an antenna that is representative of the type that will be used with the equipment in normal operation.

(g) For operations in the 698–746 MHz band, the power of any emission outside a licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, by at least $43 + 10 \log (P)$ dB. Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kilohertz or greater. However, in the 100 kilohertz bands immediately outside and adjacent to a licensee's frequency block, a resolution bandwidth of at least 30 kHz may be employed

7.2 Test method

Para. No 2.1051 Measurements required: Spurious emissions at antenna terminals.

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in § 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

[39 FR 5919, Feb. 15, 1974. Redesignated and amended at 63 FR 36599, July 7, 1998]

7.3 Test results

7.3.1 Downlink

Detector: RMS.

Modulation	Carrier	RBW VBW Span	Max. level (dBm)	Plot -
LTE Band 12 (Band Class 19)	737 MHz	1MHz 3MHz 30MHz – 8GHz	-39.7	7.3.2.1 #1
LTE Band 13 (Band Class 7)	751.5 MHz	1MHz 3MHz 30MHz – 8GHz	-38.9	7.3.2.2 #1

table 7.3-#1 Spurious Emissions at Antenna Terminals: §27.53, §2.1051 Test results

**Calculation of the limit according to §27.53 (c)(3):**

On all frequencies between 763–775 MHz and 793–805 MHz, by a factor not less than $76 + 10 \log (P)$ dB in a 6.25 kHz band segment, for base and fixed stations;

$$P_{out} = 27 \text{ dBm} = 0.501 \text{ W}$$

$$76 + 10 \cdot \log(0.501 \text{ W} / 1 \text{ W}) \text{ dB} = 73 \text{ dB Attenuation} \Rightarrow 27 \text{ dBm} - 73 \text{ dB} = -46 \text{ dBm in a 6.25 kHz band segment}$$

Spurious measured in the plot with a RBW of 1MHz so the limit is calculated:

$$\Rightarrow -46 \text{ dBm} / 6.25 \text{ kHz} + 10 \cdot \log(1 \text{ MHz} / 6.25 \text{ kHz}) = -23.96 \text{ dBm} / 1 \text{ MHz}$$

(in the frequency range 763–775 MHz and 793–805 MHz)

maximum measured emission level for frequencies between 763–775 MHz and 793–805 MHz is below -30 dBm / 1MHz.

Test passed.

Plots with test result see

plot 7.3.2.1 #2

plot 7.3.2.1 #3

plot 7.3.2.2 #2

plot 7.3.2.2 #3

Considerations to §27.53 (f):

To see if the standard 27.53(f) were met a calculation of the radiated power is necessary. The modulated carrier in the range of 747-757 MHz is working with maximum power and the frequency range of 1559-1610MHz is measured. For the calculation of the radiated power in this band, it was calculated with a typical antenna gain and typical cable loss.

Used 700 MHz narrow band antennas offer a gain of 0 dBi in the in the frequency range 1559 - 1610 MHz, furthermore an antenna cable with a loss of 2 dB is used.

The measured conducted emissions in the frequency range of 1599 - 1610 MHz are below -58,4 dBm/MHz (see at plot 7.3.2.3).

Conducted emissions (<-58.4 dBm) + antenna gain (0 dBi) - cable loss (0 dB) = radiated emissions (<-58.4 dBm) which is below the limit of Part 27.53(f).

Even with an antenna gain of 2 dBi (more than worst case) in the frequency range of 1599 - 1610 MHz, we are still under the limit of Part 27.53(f) with a radiated emission of -56.4 dBm.

Therefore the emission limit is met.

Test passed.

Plots with test result see 7.3.2.3 Downlink Measurement in the band of 1559 MHz – 1610 MHz acc. to 27.53(f)

7.3.2 Uplink

Detector: RMS.

Modulation	Carrier	RBW VBW Span	Max. level (dBm)	Plot -
LTE Band 12 (Band Class 19)	707 MHz	1MHz 3MHz 30MHz – 8GHz	-25.4	7.3.2.1 #1
LTE Band 13 (Band Class 7)	781.5 MHz	1MHz 3MHz 30MHz – 8GHz	-27.1	7.3.2.2 #1

table 7.3-#2 Spurious Emissions at Antenna Terminals: §27.53, §2.1051 Test results

Calculation of the limit according to §27.53 (c)(3):

On all frequencies between 763–775 MHz and 793–805 MHz, by a factor not less than $76 + 10 \log (P)$ dB in a 6.25 kHz band segment, for base and fixed stations;

$$P_{out} = 30 \text{ dBm} = 1.0 \text{ W}$$

$76 + 10 \cdot \log(1/1\text{W}) \text{ dB} = 76 \text{ dB Attenuation} \Rightarrow 30\text{dBm} - 76\text{dB} = -46 \text{ dBm}$ in a 6.25 kHz band segment
Spurious measured in the plot with a RBW of 1MHz so the limit is calculated:

$$\Rightarrow -46\text{dBm} / 6,25\text{kHz} + 10 \cdot \log(1\text{MHz}/6,25\text{kHz}) = -23,96\text{dBm} / 1\text{MHz}$$

(in the frequency range 763–775 MHz and 793–805 MHz)

maximum measured emission level for frequencies between 763–775 MHz and 793–805 MHz is below - 30 dBm / 1MHz.

Test passed.

The REMI version 2.135 has been used to maximize radiated emission from the EUT with regards to ANSI C63.4:2014.

Test set-up:

Test location: SAC
Both, the Fully Anechoic Chamber (FAC) and the Semi Anechoic Chamber (SAC) fulfil the requirements of ANSI C63.4 and CISPR 16-1-4 with regards to NSA and SVSWR.

Test Voltage: 110V / 60 Hz

Type of EUT: Wall mounted

Measurement uncertainty:

Measurement uncertainty expanded (95% or K=2)	± 5,0 dB for ANSI C63.4 measurement ± 2,1 dB for TIA-603 measurement
--	---

10.1 Method of Measurement

Measurement procedure. TIA-603-C

The antenna substitution method is used to determine the equivalent radiated power at spurious frequencies. The spurious emissions are measured at a distance of 3 or 10 meters. The EUT is then replaced with a reference substitution antenna with a known gain referenced to a dipole. This antenna is fed with a signal at the spurious frequency. The level of the signal is adjusted to repeat the previously measured level. The resulting eirp is the signal level fed to the reference antenna corrected for gain referenced to an isotropic dipole (see Figure 7.2).

From KDB (AMPLIFIER, BOOSTER, AND REPEATER REMINDER SHEET):

Radiated spurs (enclosure) – Use of CW signal (low, mid. and high freq.) is acceptable rather than all modulations.

The Bottom/Middle/Top frequencies for Part 27 F/H are as follows:

The maximum RFI field strength was determined during the measurement by rotating the turntable (± 180 degrees) as like defined in ANSI C63.4. A measurement receiver has been used with a RBW 120 kHz up to 1 GHz and 1 MHz above 1 GHz. Steps width during the measurement was minimum of half of the RBW.

Both, the Fully Anechoic Chamber (FAC) and the Semi Anechoic Chamber (SAC) fulfil the requirements of ANSI C63.4 and CISPR 16-1-4 with regards to NSA and SVSWR.

Figure #8.3 Substitution methods TIA/EIA-603-C

10.2 Limit

§27.53 Emission limitations / RSS-GEN sec. 4.9; RSS-131 sec. 4.4

Minimum standard:

Para. No.27.53 (c/d/g)

(c) For operations in the 746–758 MHz band and the 776–788 MHz band, the power of any emission outside the licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, in accordance with the following:

(1) On any frequency outside the 746–758 MHz band, the power of any emission shall be attenuated outside the band below the transmitter power (P) by at least $43 + 10 \log (P)$ dB.

(g) For operations in the 698–746 MHz band, the power of any emission outside a licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, by at least $43 + 10 \log (P)$ dB. Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kilohertz or greater. However, in the 100 kilohertz bands immediately outside and adjacent to a licensee's frequency block, a resolution bandwidth of at least 30 kHz may be employed

The Emission limit is **-13dBm**.

(d) For operations in the 758–763 MHz and 788–793 MHz bands, the power of any emission outside the licensee's frequency bands of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, in accordance with the following:

(1) On all frequencies between 769–775 MHz and 799–805 MHz, by a factor not less than $76 + 10 \log (P)$ dB in a 6.25 kHz band segment, for base and fixed stations;

The Emission limit is:

- **-33dBm** for measurements up to 1GHz
- **-24dBm** for measurements above 1 GHz

These Values have been calculated by a formula, which was a result of an inquiry (No. 141765) of the KDB:

$$Limit = P_{OUT} - (76 + 10 \log(P_{OUT}) - 10 \log(Bwidth / 6.25 \text{ kHz}))$$

10.3 Receiver Settings

	up to 1 GHz	above 1 GHz
Measurement bandwidth	120 kHz	1 MHz
Step width	60 kHz	500 kHz
Dwell time	20ms	
Detector	Peak	Average

10.4 Climatic values in the lab

Temperature	18,5°C
Relative Humidity	45%
Air-pressure	1014 hPa

10.5 Test results Downlink

10.5.1 30 MHz to 1 GHz Downlink (Bottom – Middle – Top) Subpart H

Bottom: 728MHz; Middle: 737MHz; Top: 746MHz

Vertical

Horizontal

The RF output power is terminated.

10.5.2 30 MHz to 1 GHz Downlink (Bottom – Middle – Top) Subpart F

Bottom: 746MHz; Middle: 751,5MHz; Top: 757MHz

Vertical

Horizontal

The RF output power is terminated.

10.5.3
10.5.4 1 GHz to 8 GHz Downlink (Bottom – Middle – Top) Subpart H

Bottom: 728MHz; Middle: 737MHz; Top: 746MHz

Vertical

Horizontal

The RF output power is terminated.

10.5.5 1 GHz to 8 GHz Downlink (Bottom – Middle – Top) Subpart F

Bottom: 746MHz; Middle: 751,5MHz; Top: 757MHz

Vertical

Horizontal

The RF output power is terminated.

10.6 Test results Uplink

10.6.1 30 MHz to 1 GHz Uplink (Bottom – Middle – Top) Subpart H

Bottom: 698 MHz; Middle: 707 MHz; Top: 716 MHz

Vertical

Horizontal

The RF output power is terminated.

10.6.2 30 MHz to 1 GHz Uplink (Bottom – Middle – Top) Subpart F

Bottom: 776 MHz; Middle: 781,5 MHz; Top: 787 MHz

Vertical

Horizontal

The RF output power is terminated.

10.6.3
10.6.4 1 GHz to 8 GHz Uplink (Bottom – Middle – Top) Subpart H

Bottom: 698 MHz; Middle: 707 MHz; Top: 716 MHz

Vertical

Horizontal

The RF output power is terminated.

10.6.5 1 GHz to 8 GHz Uplink (Bottom – Middle – Top) Subpart F

Bottom: 776 MHz; Middle: 781,5 MHz; Top: 787 MHz

Vertical

Horizontal

The RF output power is terminated.
