

### Prediction of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

Maximum peak output power at antenna input terminal: 36.00 (dBm)

Maximum peak output power at antenna input terminal: 3981.071706 (mW)

Antenna gain(typical): 0 (dBi)

Maximum antenna gain: 1 (numeric)

Time Averaging: 100 (%)

Prediction distance: 40 (cm)

Prediction frequency: 462 (MHz)

MPE limit for uncontrolled exposure at prediction frequency: 0.30666667 (mW/cm<sup>2</sup>)

Power density at prediction frequency: 0.198002 (mW/cm<sup>2</sup>)

Margin of compliance: -1.9 (dB)

This equates to 1.980022627 W/m<sup>2</sup>
