

Prediction of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density

P = power input to the antenna

G = power gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the center of radiation of the antenna

Maximum peak output power at antenna input terminal: 33.00 (dBm)

Maximum peak output power at antenna input terminal: 1995.262 (mW)

Antenna gain(typical): 0 (dBi)

Maximum antenna gain: 1 (numeric)

Prediction distance: 200 (cm)

Prediction frequency: 896 (MHz)

MPE limit for uncontrolled exposure at prediction frequency: 0.533 (mW/cm²)

Power density at prediction frequency: 0.004 (mW/cm²)

Maximum allowable antenna gain: 21.3 (dBi)

This equipment is designed for use with antennas mounted on permanent outdoor structures. The separation distance from the antenna to any nearby person will always be more than 2 meters.
