

# FCC SAR TEST REPORT

# Test File No : F690501-RF-SAR000050-A1

Equipment Under Test	Vacuum Cleaner
Model Name	A927KGMS
Applicant	LG Electronics Inc.
Address of Applicant	84, Wanam-ro, Seongsan-gu, Changwon-si, Gyeongsangnam-do, 51554, Rep. of Korea
FCC ID	BEJ-LCW007
Exposure Category	General Population/Uncontrolled Exposure
Standards	FCC 47 CFR Part 2 (2.1093)
	IEEE 1528, 2013
Receipt No.	GPWL2005000872SR
Date of Receipt	2020-05-13
Date of Test(s)	2020-05-15 ~ 2020-06-09
Date of Issue	2020-06-25
Test Result	Refer to the Page 04

In the configuration tested, the EUT complied with the standards specified above.

This test report does not assure KOLAS accreditation.

### **Remarks:**

- 1) The results of this test report are effective only to the items tested.
- 2) The SGS Korea is not responsible for the sampling, the results of this test report apply to the sample as received.

# 5 Test Methodology

ANSI C95.1–2019: IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz. It specifies the maximum exposure limit of 1.6 W/kg as averaged over any 1 gram of tissue for portable devices being used within 20 cm of the user in the uncontrolled environment. Test tests documented in this report were performed in accordance with IEEE Standard 1528-2013 and the following published KDB procedures.

# 6 Testing Environment

Ambient temperature	: 18°C ~ 25°C
Relative humidity	: 30% ~ 70%
Liquid temperature of during the test	:<± 2°C
Ambient noise & Reflection	: < 0.012 W/kg

Report File No : F690501-RF-SAR000050-A1 Date of Issue : 2020-06-25 (All SGS services are rendered in accordance with the applicable SGS conditions of service available on request and accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx.)

#### 7 **Specific Absorption Rate (SAR)**

### 7.1 Introduction

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are higher than the limits for general population/uncontrolled

### 7.2 SAR Definition

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of a given density ( $\rho$ ). The equation description is as below:

$$SAR = \frac{d}{dt} \left( \frac{dW}{dm} \right) = \frac{d}{dt} \left( \frac{dW}{\rho dv} \right)$$

SAR is expressed in units of Watts per kilogram (W/kg)

SAR measurement can be either related to the temperature elevation in tissue by

$$SAR = C\left(\frac{\delta T}{\delta t}\right)$$

Where: C is the specific head capacity,  $\delta T$  is the temperature rise and  $\delta t$  is the exposure duration, or related to the electrical field in the tissue by

$$SAR = \frac{\sigma |E|^2}{\rho}$$

Where:  $\sigma$  is the conductivity of the tissue,  $\rho$  is the mass density of the tissue and E is the RMS electrical field strength.

However for evaluating SAR of low power transmitter, electrical field measurement is typically applied.

### 7.3 Test Standards and Limits

According to FCC 47CFR §2.1093(d) The limits to be used for evaluation are based generally on criteria published by the American National Standards Institute (ANSI) for localized specific absorption rate ("SAR") in Section 4.2 of "IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz," ANSI/IEEE C95.3–2003, Copyright 2003 by the Institute of Electrical and Electronics Engineers, Inc., New York, New York 10017. These criteria for SAR evaluation are similar to those recommended by the National Council on Radiation Protection and Measurements (NCRP) in "Biological Effects and Exposure Criteria for Radio frequency Electromagnetic Fields," NCRP Report No. 86, Section 17.4.5. Copyright NCRP, 1986, Bethesda, Maryland 20814. SAR is a measure of the rate of energy absorption due to exposure to an RF transmitting

source. SAR values have been related to threshold levels for potential biological hazards. The criteria to be used are specified in paragraphs (d)(1) and (d)(2) of this section and shall apply for portable devices transmitting in the frequency range from 100 kHz to 6 GHz. Portable devices that transmit at frequencies above 6 GHz are to be evaluated in terms of the MPE limits specified in § 1.1310 of this chapter. Measurements and calculations to demonstrate compliance with MPE field strength or power density limits for devices operating above 6 GHz should be made at a minimum distance of 5 cm from the radiating source.

(1) Limits for Occupational/Controlled exposure: 0.4 W/kg as averaged over the whole-body and spatial peak SAR not exceeding 8 W/kg as averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube). Exceptions are the hands, wrists, feet and ankles where the spatial peak SAR shall not exceed 20 W/kg, as averaged over an 10 grams of tissue (defined as a tissue volume in the shape of a cube). Occupational/Controlled limits apply when persons are exposed as a consequence of their employment provided these persons are fully aware of and exercise control over their exposure. Awareness of exposure can be accomplished by use of warning labels or by specific training or education through appropriate means, such as an RF safety program in a work environment.

(2) Limits for General Population/Uncontrolled exposure: 0.08 W/kg as averaged over the whole-body and spatial peak SAR not exceeding 1.6 W/kg as averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube). Exceptions are the hands, wrists, feet and ankles where the spatial peak SAR shall not exceed 4 W/kg, as averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube). General Population/Uncontrolled limits apply when the general public may be exposed, or when persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or do not exercise control over their exposure. Warning labels placed on consumer devices such as cellular telephones will not be sufficient reason to allow these devices to be evaluated subject to limits for occupational/controlled exposure in paragraph (d)(1) of this section.

Human Exposure	Uncontrolled Environment General Population	Controlled Environment Occupational
<b>Partial Peak SAR</b> (Partial)	1.60 m W/g	8.00 m W/g
Partial Average SAR (Whole Body)	0.08 m W/g	0.40 m W/g
Partial Peak SAR (Hands/Feet/Ankle/Wrist)	4.00 m W/g	20.00 m W/g

1. The spatial Peak value of the SAR averaged over any 1g gram of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

2. The spatial Average value of the SAR averaged over the whole body.

3. The Spatial Peak value of the SAR averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

# 8 The SAR Measurement System

A block diagram of the SAR measurement System is given in Fig. 1. This SAR Measurement System uses a Computer-controlled 3-D stepper motor system (SPEAG DASY professional system). The model EX3DV4 field probe is used to determine the internal electric fields. The SAR can be obtained from the equation SAR=  $\sigma$  ( $|Ei|^2$ )/ $\rho$  where  $\sigma$  and  $\rho$  are the conductivity and mass density of the tissue-simulant.

The DASY system for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot (Staubli TX family) with controller, teach pendant and software. An arm extension is for accommodating the data acquisition electronics (DAE).
- A dosimeter probe, i.e., an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with an optical surface detector system.
- Data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.

Fig 1. The microwave circuit arrangement used for SAR system verification

- The Electro-optical converter (EOC) performs the conversion between optical and electrical of the signals for the digital communication to the DAE and for the analog signal from the optical surface detection. The EOC is connected to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- A probe alignment unit which improves the (absolute) accuracy of the probe positioning.
- A computer operating Windows.
- DASY software.
- Remote control with teach pendant and additional circuitry for robot safety such as warning lamps, etc.
- The SAM twin phantom enabling testing left-hand and right-hand usage.
- The device holder for handheld mobile phones.
- Tissue simulating liquid mixed according to the given recipes.
- Verification dipole kits allowing to validate the proper functioning of the system.

Report File No : F690501-RF-SAR000050-A1 Date of Issue : 2020-06-25 (All SGS services are rendered in accordance with the applicable SGS conditions of service available on request and accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx.)

# 9 System Components

## 9.1 Probe

Construction	:	Symmetrical design with triangular core. Built-in shielding against static charges.
		PEEK enclosure material (resistant to organic solvents, e.g., DGBE)
Calibration	:	Basic Broad Band Calibration in air Conversion Factors
		(CF) for HSL 835 and HSL1900.
		Additional CF-Calibration for other liquids and
		frequencies upon request.
Frequency	:	10 MHz to 6 GHz; Linearity: $\pm 0.2$ dB (30 MHz to 6 GHz)
Directivity	:	$\pm 0.3$ dB in HSL (rotation around probe axis)
		$\pm 0.5$ dB in tissue material (rotation normal to probe axis)
Dynamic Range	<b>e</b> : $10\mu$ W/g to > 100 m W/g;	
		Linearity: $\pm 0.2$ dB(noise: typically < 1 $\mu$ W/g)
Dimensions	:	Overall length: 337 mm (Tip length: 20 mm)
		Tip diameter: 2.5 mm (Body diameter: 12 mm)
		Distance from probe tip to dipole centers: 1 mm
Application	:	High precision dosimetric measurements in any exposure
		scenario (e.g., very strong gradient fields). Only probe
		which enables compliance testing for frequencies up to 6
		Hz with precision of better 30%

EX3DV4 E-Field Probe

# NOTE:

1. The Probe parameters have been calibrated by the SPEAG. Please reference "APPENDIX C" for the Calibration Certification Report.

### 9.2 ELI Phantom

Construction	:	Phantom for compliance testing of handheld and body- mounted wireless devices in the frequency range of 30 Mz to 6 Gz. ELI is fully compatible with the IEC 62209-2 standard and all known tissue simulating liquids. ELI has been optimized regarding its performance and can be integrated into our standard phantom tables. A cover prevents evaporation of the liquid. Reference markings on the phantom allow installation of the complete setup, including all predefined phantom positions and measurement grids, by teaching three points. The phantom is compatible with all SPEAG dosimetric probes and dipoles.	
		ELI V5.0 has the same shell geometry and is manufactured from the same material as ELI4, but has reinforced top structure	ELI Phantom
Shell Thickness	:	$2.0 \text{ mm} \pm 0.2 \text{ mm}$	
Dimensions	:	Major axis: 600 mm Minor axis: 400 mm	

### 9.3 SAM Phantom

Construction	:	The SAM Phantom is constructed of a fiberglass shell
		integrated in a wooden table. The shape of the shell is
		based on data from an anatomical study designed to
		determine the maximum exposure in at least 90 % of all
		users. It enables the dosimetric evaluation of left and right
		hand phone usage as well as body mounted usage at the
		flat phantom region. A cover prevents the evaporation of
		the liquid. Reference markings on the Phantom allow the
		complete setup of all predefined phantom positions and
		measurement grids by manually teaching three points in
		the robot
Shell Thickness	:	$2.0 \text{ mm} \pm 0.1 \text{ mm}$

: Approx. 25 liters

SAM Phantom

### 9.4 Device Holder

Construction:

Filling Volume

: In combination with the Twin SAM PhantomV4.0/V4.0C or Twin SAM, the Mounting Device (made from POM) enables the rotation of the mounted transmitter in spherical coordinates, whereby the rotation point is the ear opening. The devices can be easily and accurately positioned according to IEC, IEEE, CENELEC, FCC or other specifications. The device holder can be locked at different phantom locations (left head, right head, flat phantom).

Device Holder

# **10 SAR Measurement Procedures**

## 10.1 Normal SAR Measurement Procedure

### **Step 1: Power Reference Measurement**

The Power Reference Measurement and Power Drift Measurements are for monitoring the power drift of the device under test in the batch process. The Minimum distance of probe sensors to surface determines the closest measurement point to phantom surface. The minimum distance of probe sensors to surface is 1.4 mm. This distance cannot be smaller than the Distance of sensor calibration points to probe tip as defined in the probe properties.

### Step 2 and 3: Area Scan & Zoom Scan Procedures

The entire evaluation of the spatial peak values is performed within the Post-processing engine (SEMCAD). The system always gives the maximum values for the 1 g and 10 g cubes. The algorithm to find the cube with highest averaged SAR is divided into the following stages:

- 1. The extraction of the measured data (grid and values) from the Zoom Scan.
- 2. The calculation of the SAR value at every measurement point based on all stored data (A/D values and measurement parameters)
- 3. The generation of a high-resolution mesh within the measured volume
- 4. The interpolation of all measured values from the measurement grid to the high-resolution grid
- 5. The extrapolation of the entire 3-D field distribution to the phantom surface over the distance from sensor to surface
- 6. The calculation of the averaged SAR within masses of 1 g and 10 g.

### **Step 4: Power drift measurement**

The Power Drift Measurement measures the field at the same location as the most recent power reference measurement within the same procedure, and with the same settings. The Power Drift Measurement gives the field difference in dB from the reading conducted within the last Power Reference Measurement. This allows a user to monitor the power drift of the device under test within a batch process. The measurement procedure is the same as Step 1.

			$\leq$ 3 GHz	> 3 GHz		
Maximum distance fro (geometric center of pr	m closest i obe sensoi	measurement point rs) to phantom surface	$5 \pm 1 \text{ mm}$	$\frac{1}{2}\cdot\delta\cdot\ln(2)\pm0.5$ mm

2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz.

# **11 SAR System Verification**

The microwave circuit arrangement for system verification is sketched in Fig. 1. The daily system accuracy verification occurs within the flat section of the ELI phantom. A SAR measurement was performed to see if the measured SAR was within +/- 10% from the target SAR values. These tests were done at 2450 MHz. The tests were conducted on the same days as the measurement of the DUT. The obtained results from the system accuracy verification are displayed in the table 1. (SAR values are normalized to 1W forward power delivered to the dipole). During the tests, the ambient temperature of the laboratory was in the range  $(22 \pm 2)$  ° C, the relative humidity was in the range (55 ± 5) % R.H and the liquid depth above the ear reference points was  $\geq$  15 cm ± 5 mm (frequency  $\leq$  3 GHz) or  $\geq 10$  cm  $\pm 5$  mm (frequency > 3 G Hz) in all the cases. It is seen that the system is operating within its specification, as the results are within acceptable tolerance of the reference values.

# 14 FCC Power Measurement Procedures

The SAR measurement Software calculates a reference point at the start and end of the test to check for power drifts. If conducted power deviations of more than 5 % occurred, the tests were repeated.

# 15 Measured and Reported SAR

Per FCC KDB Publication 447498 D01v06, When SAR is not measured at the maximum power level allowed for production units, the results must be scaled to the maximum tune-up tolerance limit according to the power applied to the individual channels tested to determine compliance. For simultaneous transmission, the measured aggregate SAR must be scaled according to the sum of the differences between the maximum tune-up tolerance and actual power used to test each transmitter. When SAR is measured at or scaled to the maximum tune-up tolerance limit, the results are referred to as reported SAR. Test highest reported SAR results are identified on the grant of equipment authorization according to procedures in KDB 690783 D01v01r03.

# 16 Maximum Output Power Specifications

This device operates using the following maximum output power specifications. SAR values were scaled to the maximum allowed power to determine compliance per KDB Publication 447498 D01v06

Average power for Production (dB m)								
Mode	Channel	Normal/Maximum	Main					
902 11h	All Channels	Maximum	17.00					
802.110	All Channels	Normal	15.00					
<u>802 11 a</u>	All Channels	Maximum	16.00					
802.11g	All Channels	Normal	14.00					
802.11n	All Channels	Maximum	15.00					
HT20	All Channels	Normal	13.00					
802.11n	All Channels	Maximum	14.00					
HT40	An Unannels	Normal	12.00					

### 16.1 WLAN Maximum Output Power Specifications

# 17 RF Conducted Power Measurement

# **17.1 Conducted Power**

## WLAN 2.4 GHz

Mode	Freq. (MHz)	Ch. #	Rate	Average Power [dB m]		
	2412	1	1	17.00		
802.11b	2437	6	1	16.70		
	2462	11	1	16.50		
	2412	1	6			
802.11g	2437	6	6			
	2462	11	6			
002 11	2412	1	MCS0			
802.11n HT20	2437	6	MCS0	Not Measured		
H120	2462	11	MCS0			
002 11	2422	3	MCS0			
802.11n	2437	6	MCS0			
п140	2452	9	MCS0			

Note. Justification for test configurations for WLAN per KDB Publication 248227 D01 Wi-Fi SAR v02r02:

1. Power measurements were performed for the transmission mode configuration with the highest maximum output power specified for production units.

2. For transmission modes with the same maximum output power specification, powers were measured for the largest channel bandwidth, lowest order modulation and lowest data rate.

3. For transmission modes with identical maximum specified output power, channel bandwidth, modulation and data rates, power measurements were required for all identical configurations.

4. For each transmission mode configuration, powers were measured for the highest and lowest channels; and at the mid-band channel(s) when there were at least 3 channels supported. For channels were measured.

# 18 Transmit Antenna Separation Distances

<The Distance information of Antenna to Edges of Vacuum Cleaner>

# **19 SAR Test Exclusion Applied**

# **19.1 Vacuum Cleaner Device Type**

Based on the maximum tune-up tolerance limit of WLAN and Bluetooth, and the antenna to use separation distance,

Table "EXEMPT" SAR was not required and Table "Measure" SAR was required.

Frequency	Output	t power	Separation distances (mm)								SAR E	remption		
(MHz)	dBm	mW	Front	Rear	Left Edge	Right Edg	Тор	Bottom	Front	Rear	Left Edge	Right Edge	Тор	Bottom
2462	17.00	50.00	30.2	52.0	4.5	4.5	85.2	36.5	EXEMPT	EXEMPT	15.69 Measure	15.69 Measure	EXEMPT	EXEMPT

### Note

- 1. Maximum power is the source-based time-average power and represents the maximum RF output power among production units.
- 2. For distances < 5mm, a distance of 5mm is used to determine SAR exclusion and estimated SAR value.
- 3. Output power is the maximum rated power (including tune-up or manufacturing tolerances).
- 4. If the antenna separation distance is > 50mm then the value listed is the output power threshold, above which SAR measurement is required. For separation ≤ 50mm the value is the KDB 447498 D01v06 calculated value and must be less than 3 for SAR exemption.
- 5. Formulas round separation distance to nearest mm and power to nearest mW before calculating thresholds or exemption values.

# 20 SAR Data Summary

# 20.1 SAR measurement

# WLAN 2.45 GHz Extremity SAR

### **General Notes:**

- 1. The test data reported are the worst-case SAR values according to test procedures specified in FCC KDB Publication 447498 D01v06.
- 2. Liquid tissue depth was at least 15 cm for all frequencies.
- 3. All modes of operation were investigated, and worst-case results are reported.
- 4. The EUT is tested  $2^{nd}$  hot-spot peak, if it is less than 2 dB below the highest peak.
- 5. The manufacturer has confirmed that the device(s) tested have the same physical, mechanical and thermal characteristics and are within operational tolerances expected for production units.
- 6. SAR results were scaled to the maximum allowed power to demonstrate compliance per FCC KDB Publication 447498 D01v06.
- 7. Module SAR measurement is proceeded according to FCC inquiry requirement

- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn1507; Calibrated: 2019-09-18
- Phantom: Twin-SAM V.5.0 SN:1908; Type: SN:1908; Serial: SN:1908
- DASY52 52.10.4(1527)SEMCAD X 14.6.14(7483)

Body/2.4GHz\_WLAN\_802.11b\_Right Edge\_CH1/Area Scan (71x81x1): Interpolated grid: dx=1.000 mm, dy=1.000 mm

Maximum value of SAR (interpolated) = 5.80 W/kg

### Body/2.4GHz\_WLAN\_802.11b\_Right Edge\_CH1/Zoom Scan (7x7x7)/Cube 0: Measurement grid:

dx=5mm, dy=5mm, dz=5mm Reference Value = 55.44 V/m; Power Drift = -0.14 dB Peak SAR (extrapolated) = 8.58 W/kg **SAR(1 g) = 3.02 W/kg; SAR(10 g) = 1.23 W/kg Smallest distance from peaks to all points 3 dB below = 6 mm Ratio of SAR at M2 to SAR at M1 = 35.5\% Maximum value of SAR (measured) = 6.18 W/kg** 

Date: 2020-06-09

Test Laboratory : SGS Korea (Gunpo Laboratory) File Name: 2.4GHz\_WLAN\_802.11b\_Left Edge\_CH1.da53:0

Ambient Temp: 23.3 °C Tissue Temp: 22.0 °C

### DUT: LCW-007; Type: WLAN Module; Serial: #1

Communication System: UID 0, WLAN 2.45GHz (0); Frequency: 2412 MHz;Duty Cycle: 1:1 Medium parameters used: f = 2412 MHz;  $\sigma$  = 1.785 S/m;  $\epsilon_r$  = 40.416;  $\rho$  = 1000 kg/m<sup>3</sup> Phantom section: Flat Section

DASY52 Configuration:

- Probe: EX3DV4 - SN7413; ConvF(7.33, 7.33, 7.33) @ 2412 MHz; Calibrated: 2019-09-26

- Sensor-Surface: 1.4mm (Mechanical Surface Detection)
- Electronics: DAE4 Sn1507; Calibrated: 2019-09-18
- Phantom: Twin-SAM V.5.0 SN:1908; Type: SN:1908; Serial: SN:1908
- DASY52 52.10.4(1527)SEMCAD X 14.6.14(7483)

Body/2.4GHz\_WLAN\_802.11b\_Left Edge\_CH1/Area Scan (71x81x1): Interpolated grid: dx=1.000 mm, dy=1.000 mm

Maximum value of SAR (interpolated) = 6.02 W/kg

### Body/2.4GHz\_WLAN\_802.11b\_Left Edge\_CH1/Zoom Scan (7x7x7)/Cube 0: Measurement grid:

dx=5mm, dy=5mm, dz=5mm Reference Value = 60.70 V/m; Power Drift = 0.02 dB Peak SAR (extrapolated) = 8.38 W/kg **SAR(1 g) = 3.28 W/kg; SAR(10 g) = 1.35 W/kg Smallest distance from peaks to all points 3 dB below = 7 mm Ratio of SAR at M2 to SAR at M1 = 38.7\% Maximum value of SAR (measured) = 6.29 W/kg**

S

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS) The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

Glossary:	
TSL	tissue simulating liquid
NORMx,y,z	sensitivity in free space
ConvF	sensitivity in TSL / NORMx,y,z
DCP	diode compression point
CF	crest factor (1/duty_cycle) of the RF signal
A, B, C, D	modulation dependent linearization parameters
Polarization $\phi$	φ rotation around probe axis
Polarization 9	9 rotation around an axis that is in the plane normal to probe axis (at measurement center).
	i.e., 9 = 0 is normal to probe axis
Connector Angle	information used in DASY system to align probe sensor X to the robot coordinate system

### **Connector Angle**

Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- b) IEC 62209-1, ", "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-
- held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz)", July 2016 C)
- IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- d) KDB 865664. "SAR Measurement Requirements for 100 MHz to 6 GHz"

### Methods Applied and Interpretation of Parameters:

- NORMx,y,z: Assessed for E-field polarization 9 = 0 (f ≤ 900 MHz in TEM-cell; f > 1800 MHz. R22 waveguide). NORMx,y,z are only intermediate values, i.e., the uncertainties of NORMx,y,z does not affect the E<sup>2</sup>-field uncertainty inside TSL (see below ConvF).
- NORM(f)x,y,z = NORMx,y,z \* frequency\_response (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of ConvF.
- DCPx,y,z: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media
- PAR: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- Ax.y,z; Bx.y,z; Cx.y,z; Dx,y,z; VRx,y,z: A. B. C. D are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- ConvF and Boundary Effect Parameters: Assessed in flat phantom using E-field (or Temperature Transfer Standard for f ≤ 800 MHz) and inside waveguide using analytical field distributions based on power measurements for f > 800 MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORMx.y,z \* ConvF whereby the uncertainty corresponds to that given for ConvF. A frequency dependent ConvF is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz
- Spherical isotropy (3D deviation from isotropy): In a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset. The sensor offset corresponds to the offset of virtual measurement center from the probe tip. (on probe axis). No tolerance required.
- Connector Angle: The angle is assessed using the information gained by determining the NORMx (no uncertainty required).

Note: For details on UID parameters see Appendix

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

<sup>A</sup> The uncertainties of Norm X.Y.Z do not affect the E<sup>2</sup>-field uncertainty inside TSL (see Pages 5 and 6).
<sup>B</sup> Numerical linearization parameter: uncertainty not required.
<sup>II</sup> Uncertainty is determined using the max, deviation from linear response applying rectangular distribution and is expressed for the square of the set of the square of the set of the square of the set o field value

### Calibration Parameter Determined in Head Tissue Simulating Media

<sup>C</sup> Fréquency validity above 300 MHz of ± 100 MHz only applies for DASY v4.4 and higher (see Page 2), else it is restricted to ± 50 MHz. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Validity of ConvF assessed at 6 MHz is 4-9 MHz, and ConvF assessed at 13 MHz is 9-19 MHz. Above 5 GHz frequency validity can be extended to ± 110 MHz. Frequencies below 3 GHz, the validity of tissue parameters (r and m) can be relaxed to ± 10% if liquid compensation formula is applied to

measured SAR values. At requencies above 3 GHz, the validity of issue parameters (is and o) can be relaxed to ± 10% in indud compensation formula is applied to the ConvF uncertainty for indicated target tissue parameters. <sup>6</sup> Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

### Glossary

DAE Connector angle data acquisition electronics information used in DASY system to align probe sensor X to the robot coordinate system.

### Methods Applied and Interpretation of Parameters

- DC Voltage Measurement: Calibration Factor assessed for use in DASY system by comparison with a calibrated instrument traceable to national standards. The figure given corresponds to the full scale range of the voltmeter in the respective range.
- Connector angle: The angle of the connector is assessed measuring the angle mechanically by a tool inserted. Uncertainty is not required.
- The following parameters as documented in the Appendix contain technical information as a result from the performance test and require no uncertainty.
  - DC Voltage Measurement Linearity: Verification of the Linearity at +10% and -10% of the nominal calibration voltage. Influence of offset voltage is included in this measurement.
  - Common mode sensitivity: Influence of a positive or negative common mode voltage on the differential measurement.
  - Channel separation: Influence of a voltage on the neighbor channels not subject to an . input voltage.
  - AD Converter Values with inputs shorted: Values on the internal AD converter . corresponding to zero input voltage
  - Input Offset Measurement: Output voltage and statistical results over a large number of zero voltage measurements.
  - Input Offset Current: Typical value for information; Maximum channel input offset current, not considering the input resistance.
  - Input resistance: Typical value for information: DAE input resistance at the connector. during internal auto-zeroing and during measurement.
  - Low Battery Alarm Voltage: Typical value for information. Below this voltage, a battery alarm signal is generated.
  - Power consumption: Typical value for information. Supply currents in various operating modes.

### Appendix (Additional assessments outside the scope of SCS0108)

### 1. DC Voltage Linearity

High Range	Reading (µV)	Difference (µV)	Error (%)
Channel X + Input	199995.80	-0.62	-0.00
Channel X + Input	20002.61	0.51	0.00
Channel X - Input	-19999.44	1.91	-0.01
Channel Y + Input	199995.45	-1.19	-0.00
Channel Y + Input	20001.41	-0.69	-0.00
Channel Y - Input	-20000.77	0.63	-0.00
Channel Z + Input	199996.55	0.34	0.00
Channel Z + Input	20000.79	-1.20	-0.01
Channel Z - Input	-20000.40	1.27	-0.01

	Reading (µV)	Difference (µV)	Error (%)
+ Input	2001.16	-0.22	-0.01
+ Input	201.67	-0.02	-0.01
- Input	-198.83	-0.65	0.33
+ Input	2001.20	-0.10	-0.00
+ Input	201.18	-0.41	-0.21
- Input	-198.45	-0.18	0.09
+ Input	2000.80	-0.50	-0.02
+ Input	200.21	-1.37	-0.68
- Input	-199.06	-0.82	0.41
	+ Input + Input - Input + Input + Input - Input + Input + Input - Input	Reading (μV)           + Input         2001.16           + Input         201.67           - Input         -198.83           + Input         2001.20           + Input         201.18           - Input         -198.45           + Input         2000.80           + Input         200.21           - Input         -199.06	Reading (μV)         Difference (μV)           + Input         2001.16         -0.22           + Input         201.67         -0.02           - Input         -198.83         -0.65           + Input         2001.20         -0.10           + Input         201.18         -0.41           - Input         -198.45         -0.18           + Input         2000.80         -0.50           + Input         200.21         -1.37           - Input         -199.06         -0.82

### 2. Common mode sensitivity

DASY measurement parameters: Auto Zero Time: 3 sec; Measuring time: 3 sec

	Common mode Input Voltage (mV)	High Range Average Reading (μV)	Low Range Average Reading (µV)	
Channel X	200	0.69	-1.05	
	- 200	1.38	-0.23	
Channel Y	200	8.04	7.96	
	- 200	-8.44	-9.15	
Channel Z	200	-19.51	-19.76	
	- 200	19.18	18.88	

### 3. Channel separation

DASY measurement parameters: Auto Zero Time: 3 sec; Measuring time: 3 sec

	Input Voltage (mV)	Channel X (µV)	Channel Y (µV)	Channel Z (µV)
Channel X	200		-0.19	-3.55
Channel Y	200	7.60	-	0.87
Channel Z	200	10.14	5.44	-

Certificate No: DAE4-1507\_Sep19

accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx.)

# 4. AD-Converter Values with inputs shorted

DASY measurement parameters: Auto Zero Time: 3 sec; Measuring time: 3 sec

	High Range (LSB)	Low Range (LSB)
Channel X	16190	13110
Channel Y	15644	16407
Channel Z	15482	13875

### 5. Input Offset Measurement

DASY measurement parameters: Auto Zero Time: 3 sec: Measuring time: 3 sec Input 10MΩ

	Average (µV)	min. Offset (µV)	max. Offset (µV)	Std. Deviation (µV)
Channel X	-0.28	-1,14	0,99	0.44
Channel Y	0.40	-1.15	1.60	0.56
Channel Z	-0.03	-1.77	1.18	0.55

### 6. Input Offset Current

Nominal Input circuitry offset current on all channels; <25iA

7. Input Resistance (Typical values for information)

	Zeroing (kOhm)	Measuring (MOhm)
Channel X	200	200
Channel Y	200	200
Channel Z	200	200

# 8. Low Battery Alarm Voltage (Typical values for information)

Typical values	Alarm Level (VDC)	
Supply (+ Vcc)	+7.9	
Supply (- Vcc)	-7.6	

### 9. Power Consumption (Typical values for information)

Typical values	Switched off (mA)	Stand by (mA)	Transmitting (mA)
Supply (+ Vcc)	+0.01	+6	+14
Supply (- Vcc)	-0.01	-8	-9

Certificate No: DAE4-1507\_Sep19

Calibration Laboratory of Schmid & Partner Engineering AG Zeughausstrasse 43, 8004 Zurich, Switzerland

Schweizerischer Kalibrierdienst

Service suisse d'étalonnage C Servizio svizzero di taratura

S Swiss Calibration Service

S

Accreditation No.: SCS 0108

Accredited by the Swiss Accreditation Service (SAS) The Swiss Accreditation Service is one of the signatories to the EA Multilateral Agreement for the recognition of calibration certificates

### Glossary

arossary.	
TSL	tissue simulating liquid
ConvF	sensitivity in TSL / NORM x,y,z
N/A	not applicable or not measured

### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- b) IEC 62209-1, "Measurement procedure for the assessment of Specific Absorption Rate (SAR) from hand-held and body-mounted devices used next to the ear (frequency range of 300 MHz to 6 GHz)", July 2016
- c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

### Additional Documentation:

e) DASY4/5 System Handbook

### Methods Applied and Interpretation of Parameters:

- Measurement Conditions: Further details are available from the Validation Report at the end è. of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- Antenna Parameters with TSL: The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- SAR measured: SAR measured at the stated antenna input power.
- SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector.
- SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

### Measurement Conditions

DASY system configuration, as far as not given on page 1.

DASY Version	DASY5	V52,10.2
Extrapolation	Advanced Extrapolation	
Phantom	Modular Flat Phantom	
Distance Dipole Center - TSL	10 mm	with Spacer
Zoom Scan Resolution	dx, dy, dz = 5 mm	
Frequency	2450 MHz ± 1 MHz	

### **Head TSL parameters**

The following parameters and calculations were applied.

	Temperature	Permittivity	Conductivity
Nominal Head TSL parameters	22.0 °C	39.2	1.80 mho/m
Measured Head TSL parameters	(22.0 ± 0.2) °C	37.8 ± 6 %	1.87 mho/m ± 6 %
Head TSL temperature change during test	< 0.5 °C		

### SAR result with Head TSL

SAR averaged over 1 cm <sup>3</sup> (1 g) of Head TSL	Condition	
SAR measured	250 mW input power	13.5 W/kg
SAR for nominal Head TSL parameters	normalized to 1W	52.6 W/kg ± 17.0 % (k=2)
SAR averaged over 10 cm <sup>3</sup> (10 g) of Head TSL	condition	
SAR averaged over 10 cm <sup>3</sup> (10 g) of Head TSL SAR measured	condition 250 mW input power	6.24 W/kg

### **Body TSL parameters**

The following parameters and calculations were applied.

	Temperature	Permittivity	Conductivity
Nominal Body TSL parameters	22.0 °C	52.7	1.95 mho/m
Measured Body TSL parameters	(22.0 ± 0.2) °C	51.1 ± 6 %	2.03 mho/m ± 6 %
Body TSL temperature change during test	< 0.5 °C		

### SAR result with Body TSL

SAR averaged over 1 cm <sup>3</sup> (1 g) of Body TSL	Condition	
SAR measured	250 mW input power	12.8 W/kg
SAR for nominal Body TSL parameters	normalized to 1W	49.9 W/kg ± 17.0 % (k=2)
SAR averaged over 10 cm <sup>3</sup> (10 g) of Body TSL	condition	
SAR averaged over 10 cm <sup>3</sup> (10 g) of Body TSL SAR measured	condition 250 mW input power	5.98 W/kg

Certificate No: D2450V2-892\_Apr19

Page 3 of 8

### Report File No: F690501-RF-SAR000050-A1

accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx.)

### Appendix (Additional assessments outside the scope of SCS 0108)

### Antenna Parameters with Head TSL

Impedance, transformed to feed point	54.6 Ω + 3.6 jΩ	
Return Loss	- 25.1 dB	

### Antenna Parameters with Body TSL

Impedance, transformed to feed point	50.7 Ω + 6.2 JΩ	
Return Loss	- 24.2 dB	

### General Antenna Parameters and Design

Electrical Delay (one direction)	1.162 ns
11	( (GE 1) G

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

### **Additional EUT Data**

Manufactured by

SPEAG
