TEST REPORT

FCC Part 15 Subpart C §15.247 IC RSS-247 Issue 3 and RSS-Gen Issue 5

FCC ID: BEJTFBMEIBN3EU IC Certification: 2703H-TFBMEIBN3EU

Equipment Under Test : Telematics

Model Name

: TFBMEIBN3EU

Variant Model Name(s) : Refer to page 3

Applicant

FCC: LG Electronics USA, Inc. IC: LG ELECTRONICS INC.

Manufacturer

: LG Electronics Co., Ltd.

Date of Receipt

: 2023.12.13

Date of Test(s)

: 2024.03.04 ~ 2024.08.29

Date of Issue

: 2024.08.29

In the configuration tested, the EUT complied with the standards specified above. This test report does not assure KOLAS accreditation.

1) The results of this test report are effective only to the items tested.

1.6. Declaration by the Manufacturer

- The EUT has four ports (Port1, Port 2, Port 3, Port 4).
- Bluetooth Low Energy transmits only on Port 1.

1.7. Summary of Test Results

The EUT has been tested according to the following specifications:

APPLIED STANDARD: FCC Part 15 Subpart C, RSS-247 Issue 3 and RSS-Gen Issue 5					
Section in FCC	Section in IC	Test Item(s)	Result		
15.205(a) 15.209 15.247(d)	RSS-247 Issue 3 5.5 RSS-Gen Issue 5 8.9	Transmitter Radiated Spurious Emissions and Conducted Spurious Emission	Complied		
15.247(a)(2)	RSS-247 Issue 3 5.2(a) RSS-Gen Issue 5 6.7	6 dB Bandwidth & 99 % Bandwidth	Complied		
15.247(b)(3)	RSS-247 Issue 3 5.4(d)	Maximum Peak Conducted Output Power Cor			
15.247(e)	RSS-247 Issue 3 5.2(b)	Power Spectral Density Comp			
15.207	RSS-Gen Issue 5 8.8	AC Power Line Conducted Emission	N/A ¹⁾		

Note;

1) The AC power line test was not performed because the EUT use battery power for operation and which do not operate from the AC power lines.

1.8. Test Procedure(s)

The measurement procedures described in the American National Standard of Procedure for Compliance Testing of unlicensed Wireless Devices (ANSI C63.10-2013) and the guidance provided in KDB 558074 D01 15.247 Meas Guidance v05r02 were used in the measurement of the DUT.

1.9. Sample Calculation

Where relevant, the following sample calculation is provided:

1.9.1. Conducted Test

Offset value (dB) = Attenuator (dB) + Cable loss (dB)

1.9.2. Radiation Test

Field strength level ($dB\mu V/m$) = Measured level ($dB\mu V$) + Antenna factor (dB/m) + Cable loss (dB) - Amplifier gain (dB) + Duty factor (dB)

4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807 Tel. +82 31 428 5700 / Fax. +82 31 427 2370 http://www.sgsgroup.kr

Report Number: F690501-RF-RTL005378 Page: 6 of 43

1.10. Information of software for test

- Using the software of MobaXterm v23.6 to test for the BLE.

1.11. Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

Parameter	Uncer	rtainty
Maximum Peak Conducted Output Power	0.34	4 dB
Power Spectral Density	0.64	4 dB
99 % Bandwidth	0.02	2 MHz
6 dB Bandwidth	0.07 MHz	
Conducted Spurious Emission	0.80 dB	
Podiated Emission 0 Mg to 20 Mg	Н	3.60 dB
Radiated Emission, 9 kllz to 30 Mlz	V	3.60 dB
Dedicted Emission holow 1 Clin	Н	4.60 dB
Radiated Emission, below 1 Hz	V	4.90 dB
Padiated Emission, above 1 file	Н	3.90 dB
Radiated Emission, above 1 Glz	V	3.80 dB

All measurement uncertainty values are shown with a coverage factor of k=2 to indicate a 95 % level of confidence.

1.12. Test Report Revision

Revision	Report number	Date of Issue	Description
0	F690501-RF-RTL005378	2024.08.29	Initial

1.13. Device Capabilities

1.14. Information of Variant Models

Model Names	*Installation capability on PCB	GNSS	WiFi / BLE	Backup Battery	Model Remark	
TFBMEIBN3EU	0	0	0	0	Basic Model	
TFBMNINN0EN	Х	0	0	Χ	Variant Model	
TFBMEIBN3FR	0	0	0	0		

^{*}Cellular Antennas are mounted on TFBMEIBN3EU, TFBMNINN0EN, TFBMEIBN3FR

O: Popped X: De-Popped

Note;

All test items performed with basic model

1.15. Worst-Case Configuration and Test Mode (Bluetooth 5.3)

Modulation	Mode	Frequency (∰z)	Packet length (Byte)	RF Output Power (dBm)
	DUV 4M 2 440	37	1.60	
GFSK PHY 1M	2 440	255	<u>1.61</u>	
Gran	DLIV OM	M 2 440	37	1.76
PHY 2	PHY 2M		255	<u>1.78</u>

Remark;

The EUT supported PHY 1M, PHY 2M.

All modes were investigated.

PHY 1M and PHY 2M are tested with 255 bytes as worst condition.

Conducted tests were performed with the EUT set to transmit Low/Middle/High channels with highest output power.

4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807 Tel. +82 31 428 5700 / Fax. +82 31 427 2370 http://www.sgsgroup.kr

Report Number: F690501-RF-RTL005378 Page: 8 of 43

1.16. Duty Cycle of EUT

Regarding to KDB 558074 D01 15.247 Meas Guidance v05r02, 6, the maximum duty cycles of all modes were investigated and set the spectrum analyzer as below;

Set RBW ≥ OBW if possible; otherwise, set RBW to the largest available value. Set detector = peak or average. The zero-span measurement method shall not be used unless both RBW and VBW are > 50/T and the number of sweep points across duration T exceeds 100.

Test Mode	PHY 1M	PHY 2M
Duty Cycle (%)	85.60	57.22
Correction Factor (dB)	0.68	2.42

Remark;

- 1. Duty Cycle (%) = $(Tx \text{ on time } / Tx \text{ on + off time}) \times 100$
- 2. Correction Factor (dB) = 10 log (1 / Duty Cycle)

- Test plots

PHY 2M

4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807 Tel. +82 31 428 5700 / Fax. +82 31 427 2370 http://www.sgsgroup.kr

Report Number: F690501-RF-RTL005378 Page: 9 of 43

2. Transmitter Radiated Spurious Emissions and Conducted Spurious Emissions

2.1. Test Setup

2.1.1. Transmitter Radiated Spurious Emissions

The diagram below shows the test setup that is utilized to make the measurements for emission from 9 $\,\mathrm{kl}$ to 30 $\,\mathrm{m}$ emissions.

The diagram below shows the test setup that is utilized to make the measurements for emission from 30 $\,\text{Mz}$ to 1 $\,\text{GHz}$ Emissions.

4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807 Tel. +82 31 428 5700 / Fax. +82 31 427 2370 http://www.sgsgroup.kr

Report Number: F690501-RF-RTL005378 Page: 10 of 43

The diagram below shows the test setup that is utilized to make the measurements for emission. The spurious emissions were investigated from 1 $\, \text{GHz} \,$ to the 10th harmonic of the highest fundamental frequency or 40 $\, \text{GHz} \,$, whichever is lower.

2.1.2. Conducted Spurious Emissions

4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807 Tel. +82 31 428 5700 / Fax. +82 31 427 2370 http://www.sgsgroup.kr

Report Number: F690501-RF-RTL005378 Page: 11 of 43

2.2. Limit

2.2.1. FCC

According to §15.247(d), in any 100 klb bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 klb bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emission which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

According to §15.209(a), except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (Mb)	Field Strength $(\mu V/m)$	Measurement Distance (Meters)
0.009-0.490	2 400/F(kl也)	300
0.490-1.705	24 000/F(klb)	30
1.705-30.0	30	30
30-88	100**	3
88-216	150**	3
216-960	200**	3
Above 960	500	3

^{**} Except as provided in paragraph (g), fundamental emissions from intentional radiators operating under this section shall not be located in the frequency bands 54-72 Mb, 76-88 Mb, 174-216 Mb or 470-806 Mb. However, operation within these frequency bands is permitted under other sections of this part, e.g., §§15.231 and 15.241.

4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807 Tel. +82 31 428 5700 / Fax. +82 31 427 2370 http://www.sgsgroup.kr

Report Number: F690501-RF-RTL005378 Page: 12 of 43

2.2.2. IC

According to RSS-247 Issue 3, 5.5, in any 100 klb bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 klb bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, as permitted under section 5.4(d), the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in RSS-Gen is not required.

According to RSS-Gen Issue 5, 8.9, except where otherwise indicated in the applicable RSS, radiated emissions shall comply with the field strength limits shown in table 5 and table 6. Additionally, the level of any transmitter unwanted emission shall not exceed the level of the transmitter's fundamental emission.

Table 5 - General Field Strength Limits at frequencies above 30 地

Frequency (쌘)	Field Strength (
30-88	100
88-216	150
216-960	200
Above 960	500

Table 6 – General Field Strength Limits at frequencies below 30 ル

Frequency	Magnetic Field Strength (H-Field) (μA/m)	Measurement Distance (meters)
9-490 kHz ¹	6.37/F (F in klb)	300
490-1 705 kHz	63.7/F (F in 紀2)	30
1.705-30 Mb	0.08	30

Note¹: The emission limits for the ranges 9-90 klb and 110-490 klb are based on measurements employing a linear average detector.

4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807 Tel. +82 31 428 5700 / Fax. +82 31 427 2370 http://www.sgsgroup.kr

Report Number: F690501-RF-RTL005378 Page: 13 of 43

2.3. Test Procedures

Radiated emissions from the EUT were measured according to the dictates in section 11.11 & 11.12 of ANSI C63.10-2013.

2.3.1. Test Procedures for emission below 30 Mb

- 1. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- 2. Then antenna is a loop antenna is fixed at one meter above the ground to determine the maximum value of the field strength. Both parallel and perpendicular of the antenna are set to make the measurement.
- 3. For each suspected emission, the EUT was arranged to its worst case and then the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- 4. The test-receiver system was set to average or quasi peak detect function and Specified Bandwidth with Maximum Hold Mode.

2.3.2. Test Procedures for emission from above 30 Mb

- 3. The antenna is a bi-log antenna, a horn antenna and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- 4. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- 6. For measurements Above 1 (resolution bandwidth is set to 1 Mb, the video bandwidth is set to 3 Mb for peak measurements and as applicable for average measurements.

4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807 Tel. +82 31 428 5700 / Fax. +82 31 427 2370 http://www.sgsgroup.kr

Report Number: F690501-RF-RTL005378 Page: 14 of 43

- 1. Unwanted Emissions into Non-Restricted Frequency Bands
- The Reference Level Measurement refer to section 11.11.2 Set analyzer center frequency to DTS channel center frequency, SPAN \geq 1.5 times the DTS bandwidth, the RBW = 100 kHz and VBW \geq 3 x RBW, Detector = Peak, Sweep time = Auto couple, Trace = Max hold.
- Unwanted Emissions Level Measurement refer to section 11.11.3 Set the center frequency and span to encompass frequency range to be measured, the RBW = 100 $\,\mathrm{kHz}$ and $\,\mathrm{VBW} \ge 3 \,\mathrm{x}$ RBW, Detector = Peak, Sweep time = Auto couple, Trace = Max hold.
- 2. Unwanted Emissions into Restricted Frequency Bands
- Peak Power measurement procedure refer to section 11.12.2.4

 Set RBW = as specified in Table 9, VBW ≥ 3 x RBW, Detector = Peak, Sweep time = auto, Trace = Max hold.

Table 9 - RBW as a function of frequency

Frequency	RBW
9 kHz to 150 kHz	200 Hz to 300 Hz
0.15 Mb to 30 Mb	9 kHz to 10 kHz
30 MHz to 1 000 MHz	100 kHz to 120 kHz
> 1 000 MHz	1 MHz

If the peak – detected amplitude can be shown to comply with the average limit, then it is not necessary to perform a separate average measurement.

- Average Power measurements procedure refer to section 11.12.2.5.2

The EUT shall be configured to operate at the maximum achievable duty cycle.

Measure the duty cycle D of the transmitter output signal as described in section 11.6.

Set RBW = 1 Mb, VBW ≥ 3 x RBW, Detector = RMS, if span / (# of points in sweep) ≤ (RBW/2).

Satisfying this condition may require increasing the number of points in the sweep or reducing the span. If this condition cannot be satisfied then the detector mode shall be set to peak.

Averaging type = power (i.e., RMS).

As an alternative the detector and averaging type may be set for linear voltage averaging. Some instruments require linear display mode in order to use linear voltage averaging. Log or dB averaging shall not be used. Sweep time = auto, Perform a trace average of at least 100 traces.

A correction factor shall be added to the measurement results prior to comparing to the emission limit in order to compute the emission level that would have been measured had the test been performed at 100 percent duty cycle. The correction factor is computed as follows:

- 1) If power averaging (rms) mode was used in step f), then the applicable correction factor is [10 log (1 / D)], where D is the duty cycle.
- 2) If a specific emission is demonstrated to be continuous (D ≥ 98%) rather than turning ON and OFF with the transmit cycle, then no duty cycled correction is required for that emission.
- 3. Definition of DUT Axis.

The radiation test of the EUT was investigated in three orthogonal orientations X, Y, and Z described in the test setup photo. All radiated testing of EUT was performed with worst case axis.

2.3.3. Test Procedures for Conducted Spurious Emissions

Per the guidance of ANSI C63.10-2013, section 11.11.1 & 11.11.2 & 11.11.3, the reference level for out of band emissions is established from the plots of this section since the band edge emissions are measured with a RBW of 100 kHz. This reference level is then used as the limit in subsequent plots for out of band spurious emissions shown in section 2.4.3. The limit for out of band spurious emission at the band edge is 20 dB below the fundamental emission level measured in a 100 kHz bandwidth.

1. Conducted Emissions at Band Edge

- The Measurement refer to section 11.11.3

Set the center frequency and span to encompass frequency range to be measured, the RBW = 100 kHz and VBW ≥ 3 x RBW, Detector = Peak, Sweep time = Auto couple, Trace mode = Max hold, The trace was allowed to stabilize.

2. Conducted Spurious Emissions

- The Measurement refer to section 11.11.3

Start frequency was set to 9 № and stop frequency was set to 25 № (separated into two plots per channel), RBW = 1 №, VBW ≥ 3 x RBW, Detector = Peak, Sweep time = Auto couple, Trace = Max hold, The trace was allowed to stabilize.

3. TDF function

- For plots showing conducted spurious emissions from 9 椪 to 25 吨, all path loss of wide frequency range was investigated and compensated to spectrum analyzer as TDF function. So, the reading values shown in plots were final result.

2.4. Test Results

Ambient temperature : (23 ± 1) °C Relative humidity : 47 % R.H.

2.4.1. Radiated Spurious Emissions below 1 000 Mb

The frequency spectrum from 9 kHz to 1 000 kHz was investigated. All reading values are peak values.

Radia	ated Emiss	ions	Ant	Correction	Total		Limit
Frequency (脈)	Reading (dBµV)	Detect Mode	Pol.	(dB/ m)	Actual (dBμV/m)	Limit (dBµV/m)	Margin (dB)
30.45	45.52	Quasi Peak	V	-12.14	33.38	40.00	6.62
42.80	43.37	Quasi Peak	V	-8.76	<u>34.61</u>	40.00	5.39
63.53	35.98	Quasi Peak	V	-10.29	25.69	40.00	14.31
133.11	44.70	Quasi Peak	Н	-13.38	31.32	43.50	12.18
288.34	36.76	Quasi Peak	Н	-7.43	29.33	46.00	16.67
Above 300.00	Not detected	-	-	-	-	-	-

Remark;

- 1. Spurious emissions for all channels were investigated and almost the same below 1 @\mu.
- Test from 30 Mb to 1 000 Mb was performed using the software of ELEKTRAT(V5.02) from
- Rohde & Schwarz GmbH & Co. KG.
- 3. Reported spurious emissions are in PHY 2M / 255 bytes / Middle channel as worst case among other channels.
- 4. Radiated spurious emission measurement as below.
 - (Actual = Reading + Correction)
 - (Correction = Antenna Factor + AMP Factor + Cable Loss)
- 5. According to §15.31(o), emission levels are not report much lower than the limits by over 20 dB.

- Test plot

3.6 dB Bandwidth and 99 % Bandwidth

3.1. Test Setup

3.2. Limit

3.2.1. FCC

According to §15.247(a)(2), systems using digital modulation techniques may operate in the 902-928 Mb, 2 400-2 483.5 Mb, and 5 725-5 850 Mb bands. The minimum 6 dB bandwidth shall be at least 500 kb.

3.2.2. IC

According to RSS-247 Issue 3, 5.2(a), the minimum 6 dB bandwidth shall be 500 klb.

3.3. Test Procedure

The test follows section 11.8 DTS bandwidth of ANSI C63.10-2013. Tests performed using section 11.8.1 Option 1.

3.3.1. 6 dB Bandwidth

- Option 1:
- 1. Set RBW to = 100 kHz.
- 2. Set the VBW \geq [3 x RBW].
- 3. Detector = peak.
- 4. Trace mode = max hold.
- 5. Sweep = auto couple.
- 6. Allow the trace to stabilize.
- 7. Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 6 dB relative to the maximum level measured in the fundamental emission.

4, LS-ro 182beon-gil, Gunpo-si, Gyeonggi-do, Korea, 15807 Tel. +82 31 428 5700 / Fax. +82 31 427 2370 http://www.sgsgroup.kr

Report Number: F690501-RF-RTL005378 Page: 30 of 43

3.3.2. 99 % Bandwidth

The following conditions shall be observed for measuring the occupied bandwidth and $x \ \mathrm{d} B$ bandwidth:

- The transmitter shall be operated at its maximum carrier power measured under normal test conditions.
- The span of the spectrum analyzer shall be set large enough to capture all products of the modulation process, including the emission skirts, around the carrier frequency, but small enough to avoid having other emissions (e.g. on adjacent channels) within the span.
- The detector of the spectrum analyzer shall be set to "Sample". However, a peak, or peak hold, may be used in place of the sampling detector since this usually produces a wider bandwidth than the actual bandwidth (worst-case measurement). Use of a peak hold (or "Max Hold") may be necessary to determine the occupied / x dB bandwidth if the device is not transmitting continuously.
- ullet The resolution bandwidth (RBW) shall be in the range of 1 % to 5 % of the actual occupied / x ${
 m dB}$ bandwidth and the video bandwidth (VBW) shall not be smaller than three times the RBW value. Video averaging is not permitted.

Note: It may be necessary to repeat the measurement a few times until the RBW and VBW are in compliance with the above requirement.

For the 99 % emission bandwidth, the trace data points are recovered and directly summed in linear power level terms. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5 % of the total is reached, and that frequency recorded. The process is repeated for the highest frequency data points (starting at the highest frequency, at the right side of the span, and going down in frequency). This frequency is then recorded. The difference between the two recorded frequencies is the occupied bandwidth (or the 99 % emission bandwidth).

4. Maximum Peak Conducted Output Power

4.1. Test Setup

4.2. Limit

4.2.1. FCC

According to §15.247(b)(3), for systems using digital modulation in the 902-928 Mb, 2 400-2 483.5 Mb, and 5 725-5 850 Mb bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.

According to §15.247(b)(4), the conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraph (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

4.2.2. IC

According to RSS-247 Issue 3, 5.4(d), for DTSs employing digital modulation techniques operating in the bands 902-928 Mb and 2 400-2 483.5 Mb, the maximum peak conducted output power shall not exceed 1 W. The e.i.r.p. shall not exceed 4 W, except as provided in section 5.4(e).

As an alternative to a peak measurement, compliance can be based on a measurement of the maximum conducted output power. The maximum conducted output power is the total transmit power delivered to all antennas and antenna elements, averaged across all symbols in the signalling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or transmitting at a reduced power level. If multiple modes of operation are implemented, the maximum conducted output power is the highest total transmit power occurring in any mode.

4.3. Test Procedure

The test follows section 11.9.1.3 of ANSI C63.10-2013.

PKPM1 Peak-reading power meter method

- The maximum peak conducted output power may be measured using a broadband peak RF power meter. The power meter shall have a video bandwidth that is greater than or equal to the DTS bandwidth and shall utilize a fast-responding diode detector.

The test follows section 11.9.2.3.2 of ANSI C63.10-2013.

Method AVGPM-G (Measurement using a gated RF average-reading power meter)

- Alternatively, measurements may be performed using a wideband gated RF power meter provided that the gate parameters are adjusted such that the power is measured only when the EUT is transmitting at its maximum power control level. Since this measurement is made only during the ON time of the transmitter, no duty cycle correction is required.

Test program: (S/W name: R&S Power Viewer, Version: 3.2.0)

- 1. Initially overall offset for attenuator and cable loss is measured per frequency.
- 2. Measured offset is inserted in test program in advance of measurement for output power.
- 3. Power for each frequency (channel) of device is investigated as final result.
- 4. Final result reported on this section from R&S power viewer program includes with several factors and test program shows only final result.

4.4. Test Results

Ambient temperature : (23 ± 1) °C Relative humidity : 47 % R.H.

Test mode: PHY 1M

Mode	Channel	Frequency (쌘)	Average Power Result (dB m)	Peak Power Result (dB m)	Limit (dB m)
	Low	2 402	0.06	0.64	
GFSK	Middle	2 440	<u>1.06</u>	<u>1.61</u>	30
	High	2 480	-2.16	-1.53	

Test mode: PHY 2M

Mode	Channel	Frequency (쌘)	Average Power Result (dB m)	Peak Power Result (dB m)	Limit (dB m)
	Low	2 402	1.03	1.63	
GFSK	Middle	2 440	<u>1.08</u>	<u>1.78</u>	30
	High	2 480	-2.09	-1.35

5. Power Spectral Density

5.1. Test Setup

5.2. Limit

5.2.1 FCC

According to §15.247(e), for digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dB m in any 3 kllz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

5.2.2 IC

According to RSS-247 Issue 3, 5.2(b), the transmitter power spectral density conducted from the transmitter to the antenna shall not be greater than 8 $\,\mathrm{dB}$ m in any 3 $\,\mathrm{klz}$ band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of section 5.4(d), (i.e. the power spectral density shall be determined using the same method as is used to determine the conducted output power).

5.3. Test Procedure

The measurements are recorded using the PKPSD measurement procedure in section 11.10.2 of ANSI C63.10-2013.

- This procedure shall be used if maximum peak conducted output power was used to demonstrate compliance, and is optional if the maximum conducted (average) output power was used to demonstrate compliance.
- 1. Set analyzer center frequency to DTS channel center frequency.
- 2. Set the span to 1.5 times the DTS bandwidth.
- 3. Set the RBW to 3 kHz \leq RBW \leq 100 kHz.
- 4. Set the VBW ≥ [3 x RBW].
- 5. Detector = peak.
- 6. Sweep time = auto couple.
- 7. Trace mode = max hold.
- 8. Allow trace to fully stabilize.
- 9. Use the peak marker function to determine the maximum amplitude level within the RBW.
- 10. If measured value exceeds requirement, then reduce RBW (but no less than 3 klb) and repeat.

6. Antenna Requirement

6.1. Standard Applicable

For intentional device, according to FCC 47 CFR Section $\S15.203$, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. And according to FCC 47 CFR Section $\S15.247(b)$ if transmitting antennas of directional gain greater than $6~\mathrm{dB}~\mathrm{i}$ are used, the conducted output power shall be reduced appropriate, by the amount in dB that the directional gain of the antenna exceeds $6~\mathrm{dB}~\mathrm{i}$.

6.2. Antenna Connected Construction

Antenna used in this product is Pattern Antenna with gain of 5.06 dB i.
