

TEST REPORT

FCC Part 90

FCC Part 15 Subpart B

Industry Canada RSS-119, Issue 11

RSS-Gen, Issue 3

MANUFACTURER	Meteorcomm LLC 1201 SW 7 th Street Renton WA 98057
MODEL NUMBER(S)	63010
EUT DESCRIPTION	Wayside Radio
SERIAL NUMBER(S) TESTED	40063
TEST REPORT NUMBER	WC1104224.1B Rev C

TÜV SÜD America Inc, as an independent testing laboratory, declares that the equipment tested as specified above conforms to the applicable requirements of FCC Part 90, FCC Part 15 Subpart B, and RSS-119, Issue 11 – “Land Mobile and Fixed Radio Transmitters and Receivers Operating in the Frequency Range 27.41-960 MHz”, and RSS-Gen, Issue 3 – “General Requirements and Information for the Certification of Radio Apparatus.”

TÜV SÜD America, Inc and its professional staff hold government and professional organization certifications and are members of AAMI, ACIL, AEA, ANSI, IEEE, NARTE, and VCCI.

Not Transferable

1.0 TEST RESULT SUMMARY

Tables 1 and 2 summarize the results for the tested EUT with respect to the essential requirements defined in FCC Parts 90, 15 and RSS-119, Issue 11 and RSS-Gen, Issue 3.

1.1. Transmitter

Table 1: Transmitter results summary

FCC Section	Test	Measured	Limit	Result
§2.1033(c)(5) §90.35, §90.715	Frequency ranges		217-220 MHz – N/A 220-222 MHz	Complies
§2.1033(c)(6), (7) §2.1046, §90.205 §90.723, §90.729	Power		2 W 217-220 MHz – N/A 500 W 220-221 MHz 50 W 221-222 MHz	Complies
§2.1033(c)(4) §2.1047, §90.210	Emission types		Information only

2. Introduction

This testing is intended to verify the Meteorcomm Wayside Radio is performing in accordance with the requirements of FCC Part 90, RSS-Gen and RSS-119.

This test report consists of:

- Test result summary
- List of contents
- Introduction and further information
- Equipment application data
- Detailed test information
- List of measurement equipment with calibration validity
- Photographs and further test results (plots, graphs, etc.)

All pages have been numbered consecutively and bear TÜV SÜD America, the test report number, the date, the test specification in its current version as well as the type designation of the EUT. The total number of pages in this report is 84.

The tests were carried out on a representative assembly and in accordance with the test methods stated in:

ANSI C63.4-2003; ANSI TIA-603-C, 2004.

The sample(s) of the product was received on:

09 May 2011

The tests were carried out in the following period of time:

11 - 27 May 2011

3. Testing laboratory

The tests were carried out at TÜV SÜD America:

Wild River Lab
19333 Wild Mountain Road
Taylors Falls MN 55084
Large Test Site Open Area Test Site ☐
Small Test Site Open Area Test Site ☐

Accredited by:

NVLAP

Accreditation number 200696-0

Oakwood Lab
Oakwood Town Road
Millville MN 55957-0255

Accredited by:

NVLAP

Accreditation number 200695-0

New Brighton Environmental Testing Lab ☐
1775 Old Highway 8 NW
New Brighton MN 55112

The conducted measurements were provided by:

NextGen RF Design, Inc.
299 Johnson Ave. Suite 170
Waseca, MN 56093

4. Applicant

Company name : Meteorcomm LLC
Address : 1201 SW 7th Street, Renton WA 98057
Country : USA
Contact : Fred Cleveland
Telephone : 253 872 2521
Fax : 253 872 7662
Email : fcleveland@meteorcomm.com

5. Product and product documentation

Samples of the following apparatus were submitted for testing:

Manufacturer : CalAmp Corp
Trademark : Wayside Radio
Type designation : 63010
Serial number : 40063
Software release : Sprint v16.03
Type of equipment : Wayside Radio

For issuing this report the following product documentation was used:

Test Plan-CDF Wayside-r1

6. Conclusions, observations and comments

The test report will be filed at TÜV SÜD America for a period of 10 years following the issue of this report. It may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval from TÜV SÜD America.

TÜV SÜD America Inc reports apply only to the specific samples tested under stated test conditions. TÜV SÜD America Inc shall have no liability for any deductions, inferences or generalizations drawn by the client or others from TÜV SÜD America Inc issued reports.

TÜV SÜD America assumes the sample to comply with the requirements of FCC Section 1.1307 (b)(1) and IC RSS-102 for the respective test sector, if the test results turn out positive.

FCC 90.210(f), 90.733(e)

F – 220-222 MHz

B – 217-220 MHz - N/A

RSS-119 5.5, 5.6 and SRSP-512 4.1.5

F – 220-222 MHz

D or J – 217-218 MHz and 219-220 MHz³ – N/A

The emission mask for five contiguous channels is created by adjusting the frequency offsets described in 90.210(f) to match the bandwidth of the new channel. The diagram below visually describes the composition of a 25 kHz channel that has been created from five contiguous 5 kHz channels.

For a single 5 kHz channel, the authorized bandwidth is 4 kHz. For five contiguous channels, the authorized bandwidth is comprised of the five 4 kHz bandwidths plus the eight shared guard bands between the adjacent channels which produces an authorized bandwidth of $5 \times 4 + 8 \times 0.5 = 24$ kHz.

A 25 kHz channel emissions mask based on the band edge requirements defined in 90.210(f) would be described by the following.

90.210(f) *Emission Mask F boundary conditions (for 5 contiguous channels)*. For transmitters operating in the 220–222 MHz frequency band, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:

(1) On any frequency from the center of the authorized bandwidth f_o to the edge of the authorized bandwidth f_e : Zero dB. ($f_e = 12$ kHz)

(2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 12 kHz up to and including 13.75 kHz: $30 + 20(f_d - 12)$ dB or $55 + 10 \log(P)$, or 65 dB, whichever is the lesser attenuation.

(3) On any frequency beyond 13.75 kHz removed from the center of the authorized bandwidth f_d : At least $55 + 10 \log(P)$ dB.

The emissions mask as described in RSS-119 is very similar to the FCC mask with the exception that frequencies beyond 13.75 kHz removed from the center of the authorized bandwidth shall be attenuated 65 or $55 + 10 \log_{10}(p)$ dB whichever is the lesser attenuation. Since the FCC mask has a greater attenuation requirement for a displacement frequency beyond 13.75 kHz, the FCC attenuation requirement is used for all transmitter mask and emissions measurements as shown in the plot below.

The mask shown in the test report has been adjusted for the absolute power level of the transmitter. The FCC limit for emissions beyond the displacement frequency is $55 + 10\log_{10}(P)$. This value, when applied to the transmitter power shall always equal -25 dBm. All transmitter emissions measurements have been verified against the -25 dBm limit as shown in the mask plot below.

Testing was performed in accordance with the test procedure of ANSI TIA-603-C, clause 2.2.13 and 2.2.17

The radiated case spurious emissions were measured using a substitution method. A sample calculation is given below:

60.33 dBuV/m @ 3 m @ 443.9 MHz = -37 dBm erp
(signal generator – cable attenuation = -28.71 dBm + antenna gain of -8.36 dBd)

The Schwarzbeck VHAP/UHAP-E precision dipoles come with built in attenuators to provide a height impedance matching of the dipoles. The ideal, lossless half-wave dipole has a gain of 2.15 dBi, VHAP-E and UHAP-E have 2.15 dBi – 10 dB + 1.64 dB = -6.21 dBi, or -8.36 dBd.

The spectrum analyzer uses a peak detector. Bandwidths used are equal to or greater than 100 Hz from 9 kHz to 150 kHz, 9 kHz from 150 kHz to 30 MHz, 100 kHz from 30 MHz to 1000 MHz, and 1 MHz from 1 GHz to 40 GHz. Video bandwidths are at least three times greater than the IF bandwidth.

Conducted

Industry Canada Transmitter Conducted Emissions below 1 GHz

Tx port

Transmit mode

30 watt peak power

Modulation: DQPSK_HALF

Low channel: 220.0125 MHz

Industry Canada Transmitter Conducted Emissions below 1 GHz

Tx port

Transmit mode

30 watt peak power
