Test Data

See following pages

Frequency error data has been collected by recording the frequency error information as reported from the vector signal analyzer digital demodulation measurement function contained within the N9030A spectrum analyzer. Knowing the data rate, modulation format, and filter parameters, the digital demodulator is configured to decode the transmission data. The demodulated data is then processed by the vector signal analyzer and is then able to determine the fundamental frequency error result referenced to the center frequency of the spectrum analyzer. This method of frequency error measurement is used on digital transmissions when a suitable unmodulated RF signal is not available.

For each data point, the product was unpowered at the test temperature for a sufficient time to ensure that the frequency determining circuitry was also at the test temperature. Power was then applied to the product and a frequency error measurement was performed as soon as data communications with the test computer allowed, typically around 2 minutes after power was applied.

Frequency Stability versus temperature

Frequency: 221.0000 MHz

Modulation: DQPSK_HALF

Supply Voltage: 13.6 Vdc

Frequency (MHz)	221.000000	
Temperature °C	Freq Error (Hz)	Error (ppm)
-30	-184.45	-0.8346
-20	-131.73	-0.5961
-10	-122.80	-0.5557
0	-98.757	-0.4469
10	-12.298	-0.0556
20	12.788	0.0579
30	-46.819	-0.2119
40	-145.87	-0.6600
50	-146.62	-0.6634

Frequency Stability versus supply voltage

Frequency: 221.0000 MHz

Modulation: DQPSK_HALF

Temperature: 20°C

Frequency (MHz)	221.000000	
Voltage	Freq Error (Hz)	Error (ppm)
11.56	8.2154	0.0372
13.60	12.788	0.0579
15.64	10.721	0.0485

The emission limits shown in the above tables are based on measurements employing a CISPR quasi-peak detector except for the frequency bands above 1000 MHz. Radiated emission limits above 1000 MHz are based on measurements employing an average detector. When average radiated emission measurements are specified in this part, there also is a limit on the peak level of the radio frequency emissions. Unless otherwise specified, e.g., see §§ 15.250, 15.252, 15.255, and 15.509–15.519, the limit on peak radio frequency emissions is 20 dB above the maximum permitted average emission limit applicable to the equipment under test. Radiated emissions from the EUT are measured in the frequency range of 30 to 1000 MHz using a spectrum analyzer and appropriate broadband linearly polarized antennas. Measurements between 30 MHz and 1000 MHz are made with a 120 kHz / 6 dB bandwidth and quasi-peak detection and measurements above 1000 MHz are made with a 1 MHz RBW/VBW / 6 dB bandwidth and peak detection, 1 MHz RBW/ 10 Hz VBW for average detection. Table top equipment is placed on a non-conductive support 80 cm above the ground plane. Interface cables that are closer than 40 centimeters to the ground plane are bundled in the center in a serpentine fashion so they are at least 40 centimeters from the ground plane. Cables to simulators/testers (if used in this test) are routed through the center of the table and to a screen room located outside the test area. The antenna is positioned 3 meters horizontally from the EUT. To locate maximum emissions from the test sample the antenna is varied in height from 1 to 4 meters, measurement scans are made with both horizontal and vertical antenna polarizations and the EUT is rotated 360 degrees. When performing measurements at a distance other than that specified, the results shall be extrapolated to the specified distance using an extrapolation factor of 20 dB / decade (inverse linear-distance for field strength measurements).

Attendance

Test will be: ☒ Attended by the customer ☐ Unattended by the customer

Failure - Complete this section if testing will not be attended by the customer.

If a failure occurs, TÜV SÜD America should:

- ☐ Call contact listed above, if not available then stop testing. (After hrs phone): _____
- ☐ Continue testing to complete test series.
- ☒ Continue testing to define corrective action.
- ☐ Stop testing.

EUT Specifications and Requirements

Length: 15" Width: 10.5" Height: 3" Weight: 7.5 lb

Power Requirements

Regulations require testing to be performed at typical power ratings in the countries of intended use. (i.e., European power is typically 230 VAC 50 Hz or 400 VAC 50 Hz, single and three phase, respectively)

Voltage: 120ac/13.6dc (If battery powered, make sure battery life is sufficient to complete testing.)

EUT Software.

Revision Level: Sprint v16.03

Description: ITC Application Software Image

Equipment Under Test (EUT) Operating Modes to be Tested -- list the operating modes to be used during test.

It is recommended the equipment be tested while operating in a typical operation mode. FCC testing of personal computers and/or peripherals requires that a simple program generate a complete line of upper case H's. Provide a general description of all software, firmware, and PLD algorithms used in the equipment. List all code modules as described above, with the revision level used during testing. Consult with your TÜV Product Service Representative if additional assistance is required.

1. Transmitter radiated emissions 30 Mhz - 2200 MHz
with internal GPS upper limit = 7900 MHz
Flow = 217.6125 MHz / Modulation = DQPSK_HALF
Fhigh = 221.9875 MHz / modulation = DQPSK_HALF
2. Receiver radiated emissions 30 MHz - 2200 MHz
with internal GPS upper limit = 7900 MHz
Flow = 217.6125 MHz / Modulation = DQPSK_HALF
Fhigh = 221.9875 MHz / modulation = DQPSK_HALF
3. Power line conducted emissions

Equipment Under Test (EUT) System Components -- List and describe all components which are part of the EUT.

For FCC & Taiwan testing a minimum configuration is required. (ie. Mouse, Printer, Monitor, External Disk Drive, Motherboard, etc)
