

**2.1033(c)(8)**

Question: The dc voltages applied to and dc currents into the several elements of the final radio frequency amplifying device for normal operation over the power range.

The RF Power Amp stage operates from a 2.15V regulated supply and the typical current is 15 to 20mA.

- **2.1033(c)(9)**

Question: Tune-up procedure over the power range, or at specific operating power levels.

All manufacturing tuning performed on Automated Test Equipment. No manual tune up procedure is used.
