TEST REPORT

Report No.A-007-03-C

Date: 29 August 2003

This test report is to certify that the tested device properly complies with the requirements of:

FCC Rules and Regulations Part 95 : Radio Control (R/C) Radio Service.

The tests necessary to show compliance to the requirements were performed and these results met the specifications of requirement. The results of this report should not be construed to imply compliance of equipment other than that, which was tested. Unless the laboratory permission, this report should not be copied in part.

1. Applicant

Company Name : JAPAN REMOTE CONTROL CO., LTD.

Mailing Address : 2-2-12, EIWA, HIGASHIOSAKA-CITY, OSAKA, 577-0809 JAPAN

2. Identification of Tested Device

Type of Device : Radio Control (R/C) Transmitter
Kind of Equipment Authorization : : DoC : Certification : Verification
FCC ID : BRWXP6102
Device Name : FM 6-CHANNEL TRANSMITTER
Trade Name : JR PROPO
Model Number : XP6102
Serial Number : No.1 : Prototype : Pre-production : Production
Date of Manufacture : July 2003

3. Test Items and Procedure

: RF Power Output (Substitution Method)
: Modulation Characteristics
: Emission Bandwidth
: Field Strength of Spurious Radiation
: Frequency Stability Measurement

Above all tests were performed under: FCC Part 2 Sec2.1046, Sec2..1047, Sec2.1049, Sec2.1053, Sec2.1055 and Sec2.1057.

: without deviation, : with deviation (details are found inside of this report)

4. Date of Test

Receipt of Test Sample : 1 August 2003
Condition of Test Sample : : Damage is not found on the set.
: Damage is found on the set. (Details are described in this report)
Test Completed on : 25 August 2003

1. GENERAL INFORMATION

1.1. Product Description

The JR PROPO Model No. XP6102 (referred to as EUT in this report) is the FM 6 – CHANNEL TRANSMITTER.

- (1) Transmitting Frequency : 72.01 ~ 72.99 MHz (72.55 MHz in EUT)
- (2) QSC Xtal : 18.0 MHz
- (3) CPU1 Clock : 6.8269 MHz
- (4) Modulation : PPM or PCM
- (5) Designation of Emission : F1D
- (6) Rated Power Supply : DC 9.6V (Ni-Cd battery × 8)

1.2. Description for Equipment Authorization

- (1) Rules Part (s) under which Equipment operated
FCC Rule Part 95 ; Radio Control (R/C) Radio Service
- (2) Kind of Equipment Authorization
 - Certification Verification
- (3) Procedure of Application
 - Original Equipment Modification

1.3. Test Facility

Name : KANSAI ELECTRONIC INDUSTRY DEVELOPMENT CENTER (KEC)
IKOMA TESTING LABORATORY
Anechoic Chamber No.3

Address : 12128, Takayama-cho Ikoma-city, Nara, 630-0101 Japan

This test facility has been filed in FCC under the criteria in ANSI C63.4-1992.
The laboratory has been accredited by the NVLAP (Lab.Code:200207-0) based on ISO/IEC17025.

2. TESTED SYSTEM

2.1. Test Mode

The compliance tests were performed under the following operation mode.

(1) Measurement of Field Strength of Spurious Radiation :

The EUT was continuously transmitted in modulation mode.

(2) Frequency Stability Measurement :

The EUT was continuously transmitted in non-modulation mode.

(3) Except above two test items :

See the page of each test items.

3.2. Test Procedure

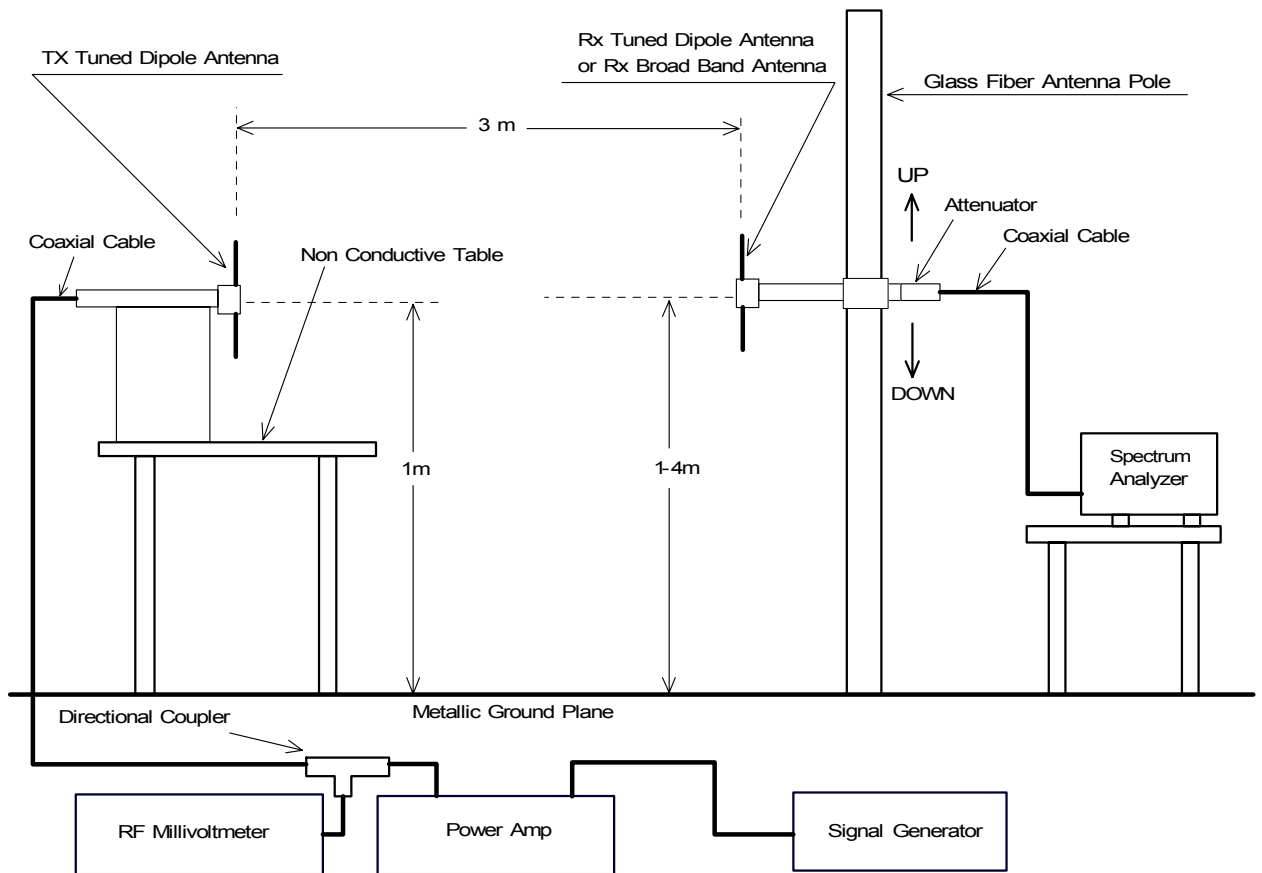

- (1) Place the transmitter to be tested (EUT) on the turntable.
- (2) Measurements shall be made from the lowest radio frequency generated in the equipment to the tenth harmonic of the carrier.
- (3) For each spurious frequency, raise and lower the test antenna from 1m to 4m to obtain a maximum reading on the spectrum analyzer with the test antenna at horizontal polarity. Then the turntable should be rotated 360° to determine the maximum reading. Repeat this procedure to obtain the highest possible reading. Record this maximum reading.
- (4) Repeat step (3) for each spurious frequency with the test antenna polarized vertically.
- (5) Remove the transmitter and replace it with a substitution antenna (the antenna should be half-wavelength for each frequency involved). The center of the substitution antenna should be approximately at the same location as the center of the transmitter. At the lower frequencies, where the substitution antenna is very long, this will be impossible to achieve when the antenna is polarized vertically. In such case the lower end of the antenna should be 0.3m above the ground.
- (6) Feed the substitution antenna at the transmitter end with a signal generator connected to the antenna by means of a non-radiating cable. With the antennas at both ends horizontally polarized and with the signal generator tuned to a particular spurious frequency, raise and lower the test antenna to obtain a maximum reading at the spectrum analyzer. Adjust the level of the signal generator output until the previously recorded maximum reading for this set of conditions is obtained. This should be done carefully repeating the adjustment of the test antenna and generator output.
- (7) Repeat step (6) with both antennas vertically polarized for each spurious frequency.
- (8) Calculate power in dBm into a reference ideal half-wave dipole antenna by reducing the readings obtained in steps (6) and (7) by the power loss in the cable between the generator and the antenna and further corrected for the gain of the substitution antenna used relative to an ideal half-wave dipole antenna.
- (9) The levels record in step (8) are the absolute levels of radiated spurious emissions in dBm. The radiated spurious emissions in dB can be calculated by the following:

$$\text{Radiated spurious emissions (dB)} = 10 \log_{10} \left[\frac{\text{TX power in watts}}{0.001} \right] - \text{the levels in step (8)}$$

Note : It is permissible to use other antennas provided they can be referenced to a dipole.

Occupied Bandwidth

I have measured the OBW by the spectrum analyzer R3261B which could measure 99% occupied bandwidth (OBW).

There are 701 data on horizontal axis of display.

One of them is V_n . Then total power P can be calculated from the following formula.

$$P = \sum_{n=1}^{701} \frac{V_n^2}{R} \quad \dots\dots\dots (1)$$

where, R is input impedance of R3261B.

Let, x is the point which gives 0.5% of the total power and y is the point which gives 99.5% of the total power. Then we can get the following formula.

$$0.005P = \sum_{n=1}^x \frac{V_n^2}{R} \quad \dots\dots\dots (2)$$

$$0.995P = \sum_{n=1}^y \frac{V_n^2}{R} \quad \dots\dots\dots (3)$$

From(1)- (3), OBW becomes .

$$OBW = \frac{Fspan \times (Y - X)}{700}$$

where, $Fspan$ is frequency span of the spectrum analyzer.
