1 SUMMARY OF RESULTS

| FCC 47 CFR Part 15. | Test Requirement | Test Limit | Comments |
|----------------------------------|---|---|---|
| 15.15 (b) | User Accessible Controls | Cannot change output power above limit. | The product contains no user accessible controls that increase transmission power above permitted levels. |
| 15.31 (e) | Vary Input AC Mains Power | Does not increase the output power above the limit. | Complies. |
| 13.33 (a) | Frequency range of radiated measurements | General Limits of 15.209, 150 kHz to 24 GHz. | E-field measurements comply |
| 15.107 | AC Conducted Emissions | Unintentional digital emissions subject to Class B limits of 15.107 | Digital emissions determined by turning transmitter off. Complies. |
| 15.109 | Radiated Emissions Requirements | Unintentional digital emissions subject to Class B limits of 15.109 | Digital emissions determined by turning transmitter off. Complies. |
| 15.203 | Antenna Connector | Permanently attached or unique coupling. | The antenna is permanently attached. Inverted F. Complies. |
| 15.204(b)(c) | System and Antennas | Marketed as a system with authorized antenna types | Integral internal antenna. Complies. |
| 15.207 (a) (b) | AC Conducted Emissions | General Limits. | Conducted emissions on AC side of DC supply. Complies. |
| 15.205 (a) (b) 15.209 (a) (c) | Radiated Emission | Comply with limits in 15.209 (a). No intentional emissions in the restricted bands of 15.205 | The radiated emissions comply with the general emission limits. Complies. |
| 15.247 (a) (2) | Carrier Frequency Separation | DTS, 6 dB BW >500 kHz | Complies. |
| 15.247 (b) (3) | Output Power | Maximum 1 W (30 dBm) | The EUT complies with the requirement. Max = 7 dBm. Complies. |
| 15.247 (b) (4) | Maximum Antenna Gain | If gain of transmitting antenna is greater than 6 dBi, the output power shall be reduced by the amount exceeding 6 dBi. | Permanently attached integral antenna is less than 6 dBi. Complies. |
| 15.247 (d) | 100 kHz BW peak power | 100 kHz BW outside band to 20 dB below 100 kHz in band for peak. 30 dB below for RMS. | Complies |
| 15.247 (e) | DTS, the conducted power spectral density | Shall be < 8 dBm in any 3 kHz band | Complies |
| 15.247 (i) | RF Exposure | Must ensure that RF MPE to the public falls within Commission Guidelines | Complies See RF Exposure Section. |

1.1 47 CFR Part 15, Subpart B / Subpart C

| Part | PARAMETER TO BE MEASURED | Applies | Comments |
|---|---|---------|----------|
| SubPart B, Unintentional Radiators (Class B) | | | |
| 15.107(a) | Conducted Emission Limits, Digital Device, CLASS B | X | Complies |
| 15.107(b) | Conducted Emission Limits, Digital Device, CLASS A | | |
| 15.109(a) | Radiated Emissions Limits, Digital Device, CLASS B | X | Complies |
| 15.109(b) | Radiated Emissions Limits, Digital Device, CLASS A | | |
| SubPart C, Intentional Radiators (General Limit) | | | |
| 15.207 | Conducted Disturbance (Conducted Emissions, 0.15-30 MHz) | X | Complies |
| 15.209 | Radiated Disturbance (Radiated Emissions, 0.009 to 10 GHz) | X | Complies |
| 15.247(a)(2) | 6 dB Bandwidth at least 500 kHz | X | Complies |
| 15.247(b)(3) | 1 Watt limit into max 6 dBi antenna | X | Complies |
| 15.247(d) | 100 kHz Out-of-band emission 20 dB< 100 kHz inband peak 100 kHz Out-of-band emission 30 dB< 100 kHz inband average Unwanted emissions below 15.209(a) if in 15.205(a) restricted bands. | X | Complies |
| 15.247(e) | Power Spectral Density average < 8 dBm in any 3 kHz band | X | Complies |

Compliance with 15.203:

This product is professionally installed and setup, therefore the device is compliant with the requirement of this clause.

Compliance with 15.204:

The antenna used with the transmitter is permanently mounted internal to the EUT.

1.2 IC RSS GEN

| Clause | PARAMETER TO BE MEASURED | Applies | Comments |
|--------|--------------------------|---------|----------|
| 4.6.1 | Occupied Bandwidth, 99% | X | |
| 4.6.2 | 6 dB Bandwidth | X | 1.64 MHz |

2 GENERAL

2.1 Test Site Registration

The Tyco Safety Products / Sensormatic Electronics, LLC OATS located at 6600 Congress Ave. Boca Raton, FL. 33487 is registered with the FCC, number – 889978 and 616407, and with Industry Canada, number – 3506A-1.

2.2 Test Procedures

Both conducted and radiated emissions testing were performed according to the procedures in ANSI C63.4-2003, as required by 47 CFR Part 15 Subpart A Section 15.31(a)(3), 15.107, 15.109, 15.207, 15.209.

15.247 requirements were measured according to ANSI C63.10-2013 per FCC document 558074 D01 DTS Meas Guidance v03r01 - “**Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247**”

Accessory Equipment used during testing are all FCC DoC, Verified, or Certified products. This includes ITE power supplies.

The digital portion of the radio was evaluated according to the DoC procedures.

EUT was tested with modulation and without modulation in CW >98% duty cycle for worst case.

Radiated evaluations were performed in a pre-screen environment and the worst case was tested on the OATS. Multiple orientations of radio were evaluated to determine worst case.

Maximum conducted transmit power was measured at a temporary RF connector on the transmitter in place of the antenna.

2.3 Sample Calculation – Radiated & Conducted Emissions

The field strength is calculated by subtracting the Amplifier Gain and adding the Cable Loss and Antenna Correction Factor to the measured reading. The basic equation is as follows:

$$\text{Field Strength (dB}\mu\text{V/m)} = \text{RAW} - \text{AMP} + \text{CBL} + \text{ACF}$$

Where:

RAW = Measured level before correction (dB μ V)

AMP = Amplifier Gain (dB)

CBL = Cable Loss (dB)

ACF = Antenna Correction Factor (dB/m)

$$\text{dB}\mu\text{V/m} = 20 * \log * \mu\text{V/m}$$

Margin to Limit is calculated by subtracting corrected measurement from Limit.
Positive margin indicates compliance. Negative margin indicates non-compliance

To convert dB μ V/m to dB μ A/m,

Reduce reading in dB μ V/m by 51.5 dB to convert to dB μ A/m.

Per IC RSS-Gen, Ver. E, Section 4.8,

The following formula may be used to convert field strength (FS) in volts/metre to transmitter output power (TP) in watts:
 $TP = (FS \times D) / (30 \times G)^2$

Where D is the distance in meters between the two antennas and G is the antenna numerical gain referenced to isotropic gain.

(Note: In an open-area test measurement, the effect due to the metal ground plane should be subtracted from the maximum field strength value in order to reference it to free space, before calculating TP.)

Effective Radiated Power is converted to Field Strength by the following:

The Friis transmission equation governs the interaction between two antennas in the far field:

$$P_r = \frac{P_t G_t G_r \lambda^2}{(4\pi r)^2}, \quad (5)$$

where P_r is the power measured at the receive antenna output port;

P_t is the power measured at the transmit antenna input port;

G_t is the gain of the transmit antenna;

G_r is the gain of the receive antenna;

λ is the wavelength; and

r is the separation between the two antennas (the range length).

The electric field generated at a point in the far field as a function of the transmitted power is given by

$$E = \frac{\sqrt{30 P_t G_t(\theta, \phi)}}{r}, \quad (12)$$

where E is the electric field generated at the distance r from the transmit antenna,

P_t is the power measured at the transmit antenna input port,

$G_t(q, f)$ is the angle-dependent gain of the transmit antenna, and

r is the distance from the transmit antenna to the test point (the range length)

Info: <http://www.ce-mag.com/archive/02/Spring/fogelle2.html>

Note:

power levels into a dipole results in an E-field at a distance according to power: $(V^2) / R = P$

power flux density: $s = PG / (4\pi r^2)$, where $\pi = 3.14$ and r = distance

Field strength: $e = \sqrt{120 \pi s} = \sqrt{30 P} / r$

A half-wave dipole has a 1.64 gain in its equatorial plane, therefore:

$e = \sqrt{1.64 \cdot 30 P} / r = 7 \sqrt{P} / r$

Field strength $e = (7.02 \sqrt{ERP}) / d$. ERP in Watts, d in meters.

Or Source Radiating (ERP) -> $ERP = (e \cdot d / 7.02)^2$ in Watts, Volts/meter, meters

Conversion to dBuV from http://www.compeng.com.au/emc_conversion_tables_rf_calculator2.aspx

2.4 Uncertainty of Measurements

| Combined Standard Uncertainty and Expanded Uncertainty using an expansion factor of 2. (estimated) | | CISPR 16-4-2 Uncertainty Limits |
|--|--------------------------------|---------------------------------------|
| Radiated Emissions = ± 1.56 dB | Expanded Uncertainty = 3.12 dB | 5.2 dB |
| Conducted Emissions = ± 1.12 dB | Expanded Uncertainty = 2.24 dB | 3.6 dB |
| Harmonic Current and Flicker = ± 2.6 % | Expanded Uncertainty = 5.12 % | |
| Radiated Immunity = ± 2.15 dB | Expanded Uncertainty = 4.3 dB | |
| ESD Immunity = 4.15 % | Expanded Uncertainty = 8.3 % | |
| EFT - Fast Transient Immunity = ± 2.82 % | Expanded Uncertainty = 5.64 % | |
| Conducted Immunity = ± 1.83 dB | Expanded Uncertainty = 2.24 dB | |
| Voltage Variation and Interruption = ± 1.7 % | Expanded Uncertainty = 3.4 % | |
| Surge Immunity = ± 3.1 % | Expanded Uncertainty = 6.2 % | |

Uncertainty values were calculated based on methods in ETSI TR 100 028.

Per EN 302 208-1, Clause 7, the value of the measurement uncertainty for each measurement, shall be equal to or lower than the figures given below.

Parameter Uncertainty

| | |
|---|-----------------------|
| RF frequency | $+/-1 \times 10^{-7}$ |
| RF power, conducted | $+/-0,75$ dB |
| RF power, radiated, valid up to 12,75 GHz | $+/-6$ dB |
| Maximum frequency deviation for FM | $+/-5$ % |
| Two-signal measurements | $+/-4$ dB |
| Time | $+/-5$ % |
| Temperature | $+/-1$ K |
| Humidity | $+/-5$ % |

3 DESCRIPTION AND CHARACTERISTICS OF THE EUT

3.1 Model / Type Designation

The model or type designation may be either a single alphanumeric code or an alphanumeric/code divided into two parts.

1. Equipment Series

AMB-4400

2. Equipment Specific

AMB-4410

3.1.1 Marketing And Installation Environment

Either (FCC 15: Sub-part B, Class A or B) – Unintentional Radiator

[] Emissions Class A is non-residential, not advertised or marketed to general public.

or

[] Emissions Class B is anywhere; advertised and marketed to general public

And/or

[X] FCC 15, Sub-part C – Intentional Radiator

This system is professionally installed.

3.1.2 Overview

This report is part of the application for FCC Certification of a IEEE 802.15.4 transceiver operating in the 2400-2483.5 MHz.

The EUT is a battery powered handheld device that is used to detect and deactivate EAS tags.

Synchronization with other units is provided by a radio link in the 2.4 GHz band to a FCC ID: BVCAMB43.

The EUT can be mounted together with a variety of barcode scanners which provides a signal that indicates a barcode has been read. The EUT then charges the deactivation circuit and begins a tag detection routine that triggers the deactivation circuit when an EAS tag is detected.

This unit is a single construction with numerous plastic adapters used to attach or mount the single unit to other devices made by other manufacturers.

There is also a battery charging station while the EUT is not in use.

3.1.3 Environment

Ambient temperature0°C to 50°C, (32°F to 122°F)

Relative humidity0 to 90%, non-condensing

3.1.4 Frequency Characteristics and Internal Clocks

Transmitter: IEEE 802.15.4 transceiver (DSSS)

Operating frequency 2400-2483.5 MHz

EAS tag detection 58 kHz

Clocks:

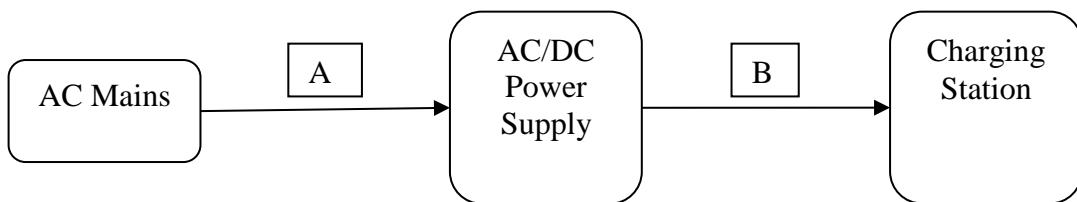

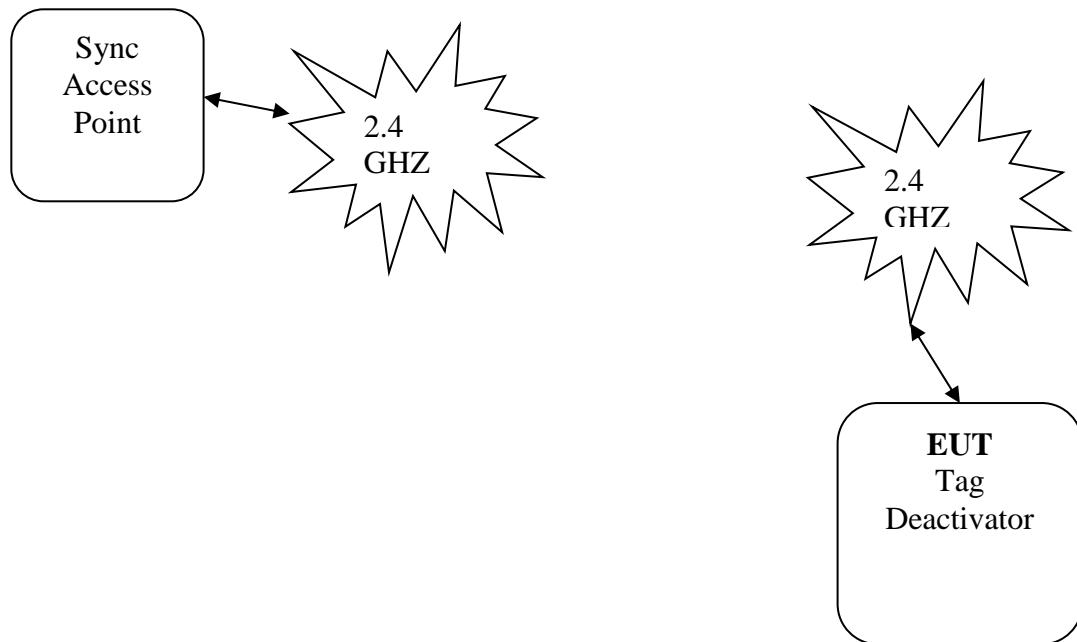

96 MHz

48 MHz

32 MHz

24 MHz

high

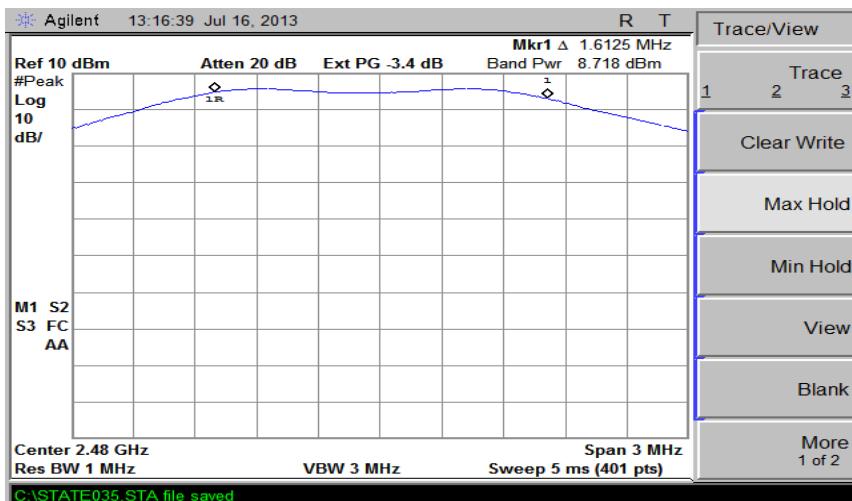

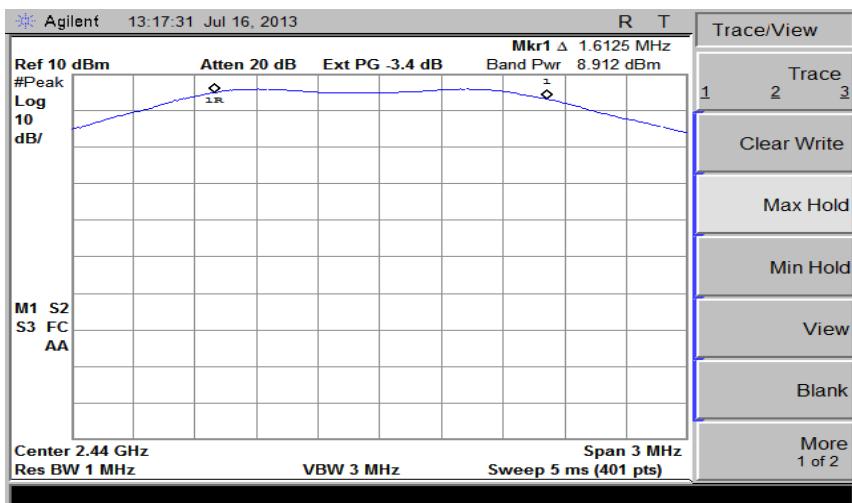

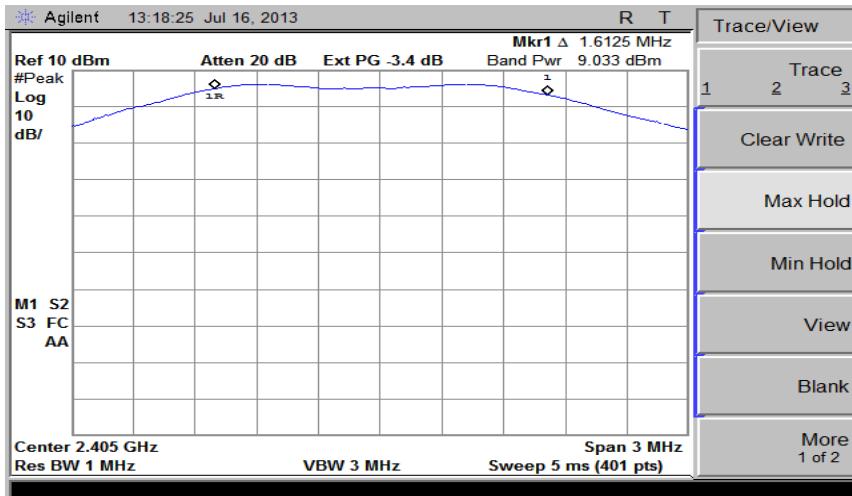

4.5 Max Conducted Power Output, 15.247 (b)(3)

The maximum output power limit for DTS devices is specified as 1 watt (30 dBm) when expressed in terms of either maximum (**average**) conducted output power or maximum (**peak**) conducted output power.

Max Average (5.9 dBm + 3.3 dBi AG + 0 dB = 9.2 dBm EIRP – 20log3 + 104.8 = 104.1 dBuV = 0.16 V/m)

Max Peak Conducted

4.6 Spurious RF Conducted Emissions, 15.247 (d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

Scans with emissions follow.

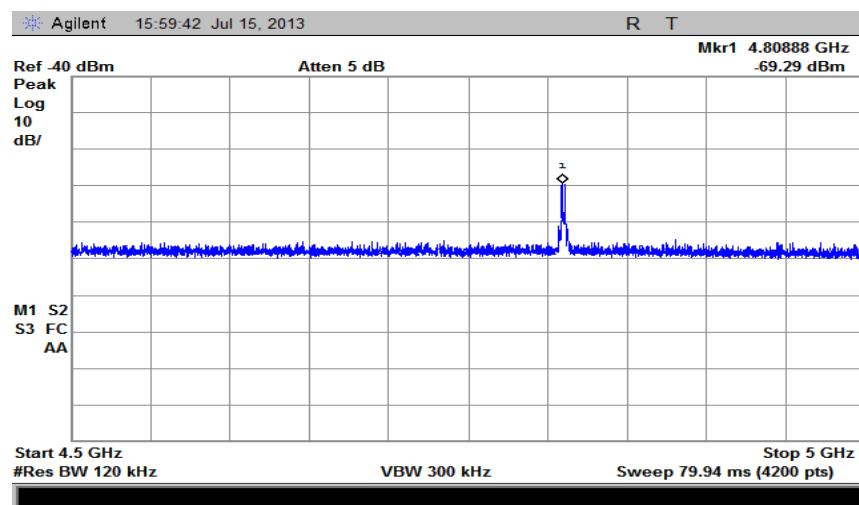

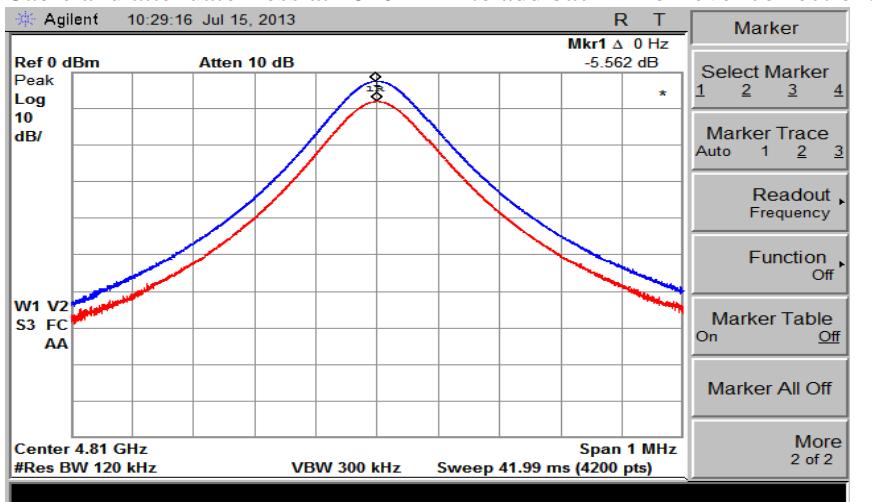

Low Fundamental. Band edge is 2400 MHz; emissions are more than 30 dB below the in band signal

2nd Harmonic. (-69.29 + 5.56 = -63.73 dBm)

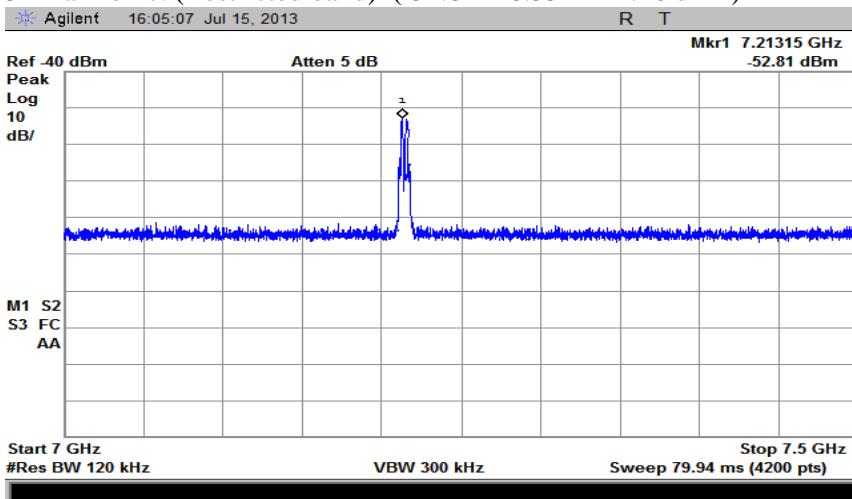

Cable and attenuator loss at 4810 MHz to add back in for level correction.

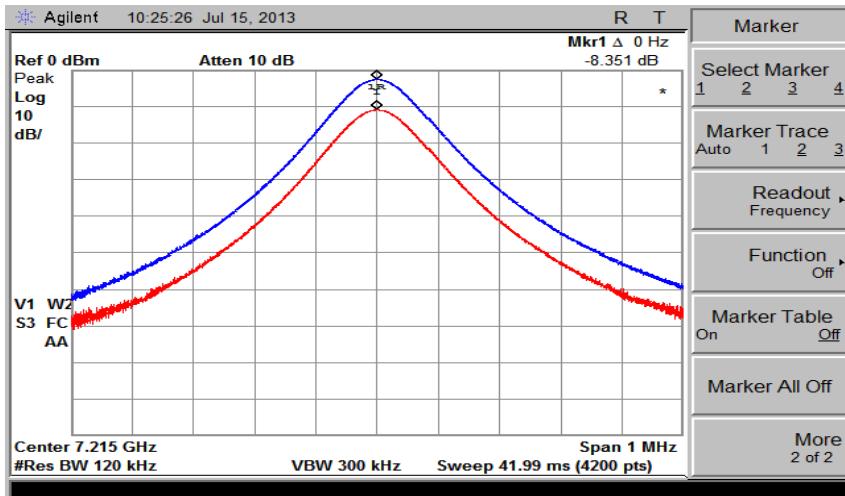

Scans between harmonics did not show any frequencies.

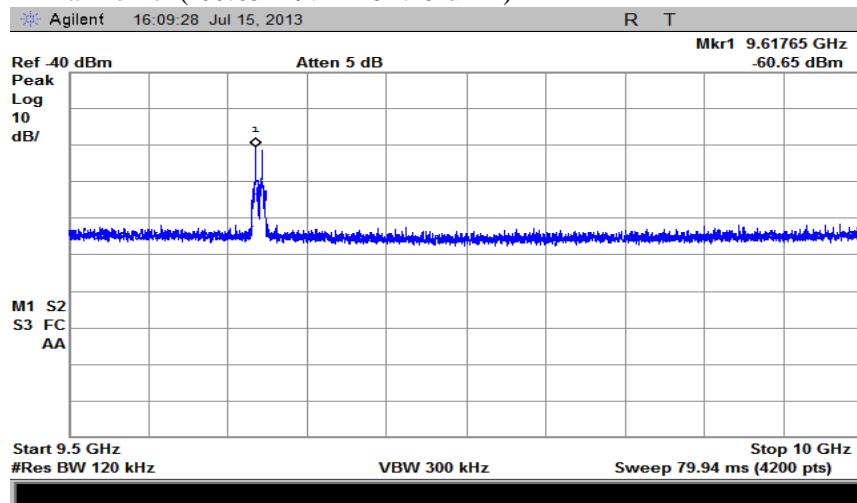

3rd Harmonic. (Restricted band) (-52.81 + 8.35 = -44.46 dBm)

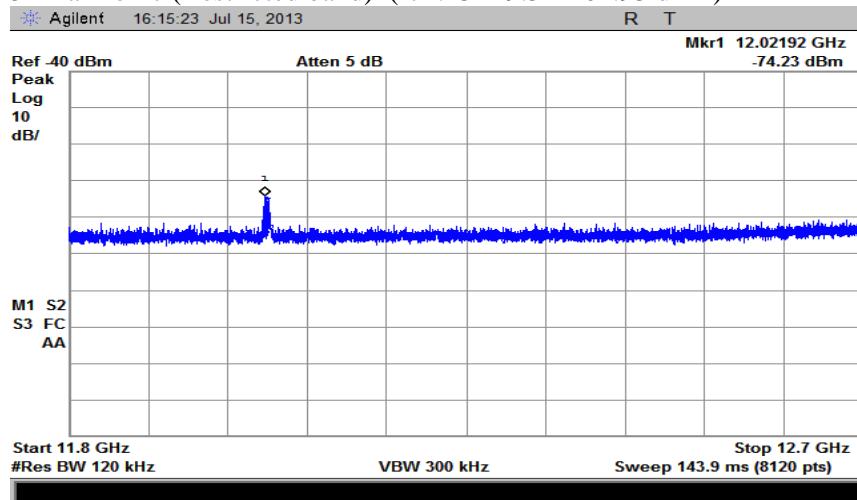

Cable and attenuator loss for level correction.

4th Harmonic (-60.65 + 9.2 = -51.45 dBm)

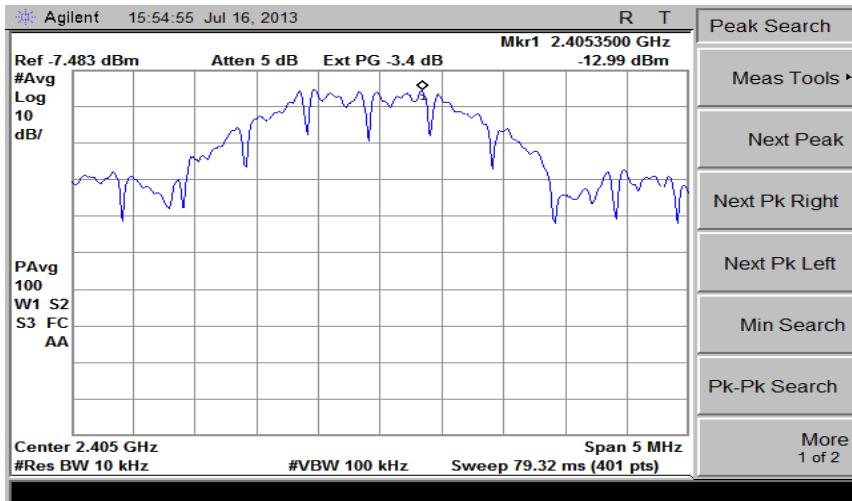

5th Harmonic (Restricted band) (-74.23 + 9.3 = -64.93 dBm)

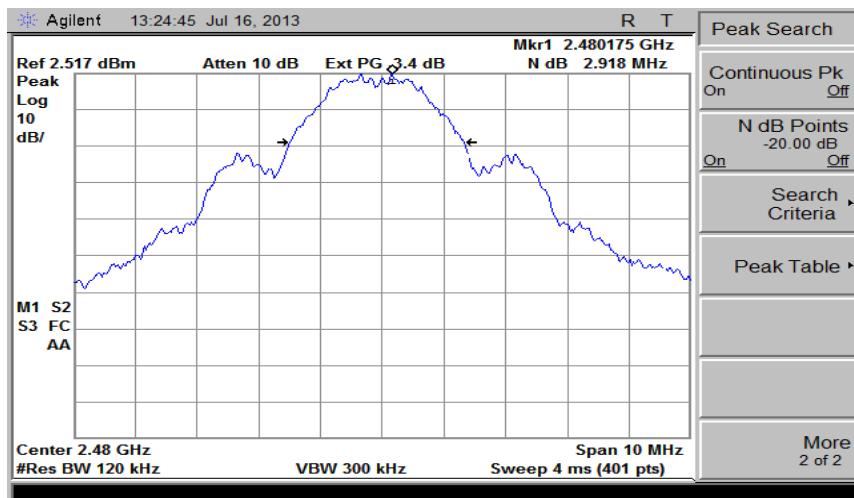

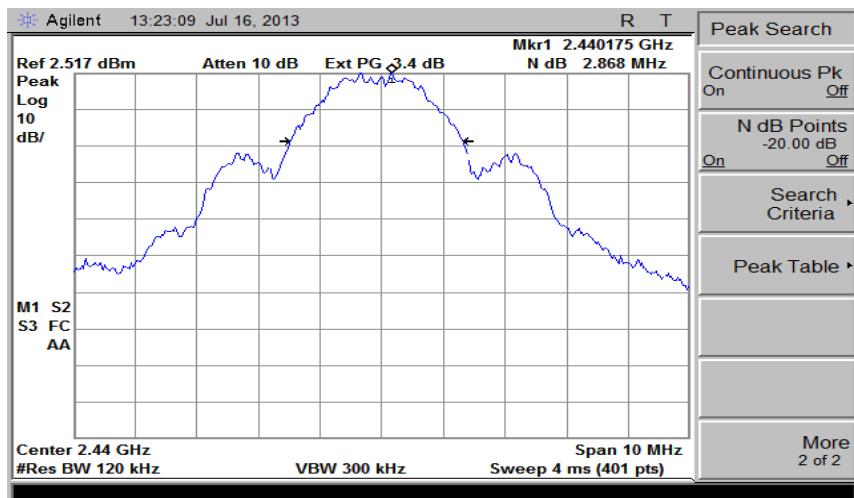

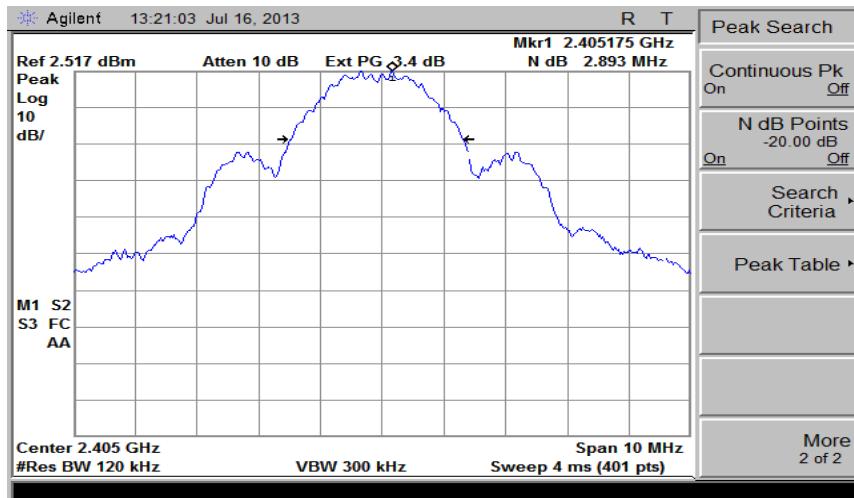

No more harmonics or emissions were detected in scans up to ten times the fundamental.

4.7 Maximum power spectral density level in the fundamental emission. 15.247 (e)

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

4.8 20 dBc Bandwidth from highest level

4.9 Input Voltage Variation, 15.31(e).

Output power set to Maximum, 7 dBm.

Battery powered.

4.10 RF Exposure Compliance Requirements per 15.247 (b) (5), 2.1093 (d)(1) Portable

Operating Band Center Frequency = 2441.75 MHz, Range 2400-2483.5 MHz

EUT Max Output Power = 7 dBm

Antenna Gain = 3.3 dBi => Numeric Gain = 2.14

MPE Power Density Limit for General Population is $S = 1 \text{ mW/cm}^2$

(CFR 47 Part 1.1310, Table 1)

Minimum MPE safe distance (using equation below) = 0.92 cm

Calculations:

$$\text{Power Density } Pd = (Pt * G) / (4 * \pi * d^2)$$

Solve for d

$$d^2 = (Pt * G) / (4 * \pi * Pd)$$

$$d = \text{SqrRoot}((Pt * G) / (4 * \pi * Pd))$$

$$d = \text{SqrRoot}((5.01 \text{ mWatt} * 2.14 \text{ gain}) / (4 * \pi * 1 \text{ mWatt/cm}^2))$$

$$d = \text{SqrRoot}((10.72 / 4 * \pi * 1) \text{ cm}^2)$$

$$d = \text{SqrRoot}(0.853 / \pi) \text{ cm}^2$$

$$d = 0.92 \text{ cm}$$

Where

Pt= Transmit Power In mWatts

G = Numeric Antenna Gain

d = Distance in cm

Pd = Power Density in mW / square cm

Per IC: RSS-102i4, 4.2.

Power Density Limit for General Population is $S = 1 \text{ mW/cm}^2 = 10 \text{ W/m}^2$

Same as above;
