I. General Information

| PRODUCT TESTED: | Hand Held Deactivator (HHD) FCC ID: BVCDEACHH | Hand Held Deactivator (HHD) FCC ID: BVCDEACHH | | | | |
|---------------------|--|--|--|--|--|--|
| TEST DATE: | July 13-19, 2000 | July 13-19, 2000 | | | | |
| SUMMARY OF RESULTS: | | | | | | |
| 47 CFR 15.207 | CONDUCTED EMISSIONS | PASS | | | | |
| 47 CFR 15.209 | RADIATED EMISSIONS | PASS | | | | |

1.1 Test Methodology

Both conducted and radiated emissions testing were performed according to the procedures in ANSI C63.4-1992, and the requirements of 15.31, 15.33, 15.35, 15.207, and 15.209. Radiated emissions measurements were performed at a distance of 3 meters and the results extrapolated to the distance specified per 15.31 and 15.209.

1.2 Test Facility

The shielded room conducted emissions measurement facility is located at Sensormatic Electronics Corporation Headquarters at 951 Yamato Road, Boca Raton, Florida, 33431. The radiated emissions site is located at Sensormatic Electronics Corporation manufacturing location, 6600 Congress Avenue, Boca Raton, Florida 33487. These sites have been found acceptable by and are on file with the FCC per FCC letter 31040/SIT 1300F2. 1.3 Test System Description.

The HHD system consists of a charging base and a hand held unit. The hand held unit consists of a battery, power supply/transmitter electronics, receive electronics, data processing electronics, deactivation electronics and a multi-turn coil antenna common to transmit, receive and deactivation.

The product tested was an engineering prototype built to production drawings.

II. Conducted Emissions

Conducted emissions data are presented in Section V "Data", Part A "Conducted Emissions".

The hand held unit was plugged into the base unit and the transmit function was enabled. The battery was discharged prior to initiating the test. The product demonstrated compliance with the requirements of 15.207. The product was tested at 120 V, 60 Hz.

III. Radiated Emissions

Radiated emissions data are presented in Section V "Data", Part B "Radiated Emissions". The product demonstrated compliance with the requirements of 15.209. Radiated emissions measurements were performed at 3 meters. Propagation loss assumed square law roll-off as permitted by the rules; the measurements were extrapolated to 300 meters as required.

The hand-held unit was fully charged prior to initiating tests. It was mounted in a vertical position, i.e., the loop antenna was in the vertical plane. Maximum radiation was determined by first assessing symmetry while applying incremental rotation of the turntable. The product exhibited quadrant symmetry. Measurements were taken at radials of 22.5° throughout one quadrant; the measurement antenna was rotated for maximum pickup about the vertical axis of the measurement antenna at each radial. The maximum emission was determined to be with the measurement loop antenna in the vertical polarization, parallel to the radiating loop of the HHD.

FCC ID: BVCDEACHH

The product was tested and results reported using peak detection. In addition, the product was eligible for extrapolation by calculating the roll off factor as determined by measurements at 2 distances. Although peak detection and square law extrapolation are more severe than required by the rules, measurements using these techniques were sufficient to demonstrate compliance of this product with the FCC rules.

IV. LIST OF MEASURING EQUIPMENT

The equipment used for determining compliance of the HHD system with the requirements of 15.207 and 15.209 is marked with an "X" in the first column of the table below.

| | <u>Model</u> | Description | <u>Vendor</u> | Serial # |
