## Summary of Results

FCC 47 Part 15. Subpart C.	Test Requirement	Test Limit	Comments
15.15 (b)	User Accessible Controls	Cannot change output power above limit.	The product contains no user accessible controls that increase transmission power above permitted levels.
15.31 (e)	Vary Input Power	Does not increase the output power above the limit.	Input was varied from 102 to 138 VAC. Input power to antenna was measured. Complies.
15.107	AC Mains Conducted Emissions Requirements [Digital Device]	See Table 15.107. Unintentional digital emissions subject to Class A limits.	Digital emissions determined by turning transmitter off. Complies [Verification].
15.109	Radiated Emissions Requirements [Digital Device]	See Table 15.109. Unintentional digital emissions subject to Class A limits.	Digital emissions determined by turning transmitter off. Complies [Verification].
15.203	Antenna Connector Requirements	Permanently attached or unique coupling. for non-professionally installed.	The radio to antenna connectors are MCX to RP TNC connectors. Complies.
15.207 (a) (b)	AC Mains Conducted Emissions Requirements.	General Limits. Equivalent to 15.109 Class B.	Conducted emissions on AC side of DC supply. . Complies.
15.205 (a) (b) 15.209	Restricted Band Compliance	Must comply with limits specified in 15.209 (a). Equivalent to 15.109 Class B.	The spurious emissions in the restricted bands comply with the general emission limits.
15.247 (a) (1)	Carrier Frequency Separation	Separated by minimum of 25 kHz or 20 dB BW of the hopping channel, whichever is greater.	The carrier frequencies are separated by at least the 20 dB BW of the hopping channel. Complies.
15.247 (a) (1) (i)	Number of Hopping Frequencies.	If 20 dB BW is less than 250 kHz, then shall use at least 50 hopping channels, using frequencies in a pseudo random list.	The EUT has 50 hopping channels and complies with the requirement.
15.247 (a) (1) (i)	Dwell Time – Number of Hopping Frequencies > 25	< 0.4 sec within a 20 second period	The EUT complies with the requirement.
15.247 (b) (2) (3)	Output Power 902-928 MHz Tx	Maximum 1 W – frequency hopping with 50+ channels	The EUT complies with the requirement.
15.247 (b) (4)	Maximum Antenna Gain	If directional gain of transmitting antenna greater than 6 dBi, the peak output power of the device shall be reduced below the stated values by the amount in dB exceeding 6 dBi.	Permanently attached attenuators on each antenna ensure compliance.
15.247 (b) (5)	RF Exposure	Must ensure that RF MPE to the public falls within Commission Guidelines OET-65.	Complies. See RF Exposure Section.
<p>These results are deemed satisfactory evidence of compliance with  <b>Industry Canada Interference-Causing Equipment Standard ICES-003 and Radio Standard RSS-210.</b></p>			

## General Information

The product covered by this report is the Sensormatic IDX-9000-US Reader.

This report is part of the application for Certification of a RFID reader operating in the 902-928 MHz bands under the rules provided for frequency-hopping transmitters found in 47 CFR subpart C, 15.247.

The digital portion of the radio was evaluated according to the Verification procedures for a Class A device in subpart B.

The EUT is a RFID radio transceiver with 30 dBm maximum output power and 16 ports that are used one at a time.

The EUT can accommodate up to 16 transmit antennas on 16 electrically identical transmit ports. However, only one port, and therefore one antenna, can be active at a time. Under no circumstances can more than one transmitter be on at one instance in time.

Both conducted and radiated emissions testing were performed according to the procedures in ANSI C63.4-2003, as required by 47 CFR Part 15, Subpart A, Section 15.31, Subpart C, 15.207, 15.209, 15.247

15.247 requirements were measured per FCC document DA 00-705, "Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems", released March 30, 2000.

Accessory Equipment used to terminate ports and communicate are all commercially available FCC DoC or Verified products. This includes ITE power supplies, PC's, network switches and hubs.

### Radiated Measurements

List of antennas that can be used with the EUT:

**Manufacturer Model Number Type Composite Gain**

Symbol AN480-CL66100WR LHCP 6 dBiL

Symbol AN480-CR66100WR RHCP 6 dBiL

Sensormatic IDA-2x00 series CP

Sensormatic IDA-1000 CP

Sensormatic IDKM-1000, Loop, Gain -10.3 dBi, table top

Sensormatic IDKM-1010, Loop, Gain -10.3 dBi, flush mount

All antennas were evaluated to determine worst case emissions

All ports were evaluated for worst case emissions

EUT was tested with modulation and without modulation for worst case

Radiated evaluations were performed in a pre-screen environment and the worst case was tested on the OATS.

Multiple orientations of antenna and radio were evaluated to determine worst case.

Maximum conducted transmit power was measured at the RF port of the radio using a ~1 ft cable to the spectrum analyzer.

Test Facility:

Measurements were performed at Tyco Safety Products / Sensormatic Electronics, LLC.

The shielded room conducted emissions measurement facility is located at Sensormatic Electronics LLC. Headquarters at 6600 Congress Avenue, Boca Raton, Florida, 33487. The radiated emissions Open Area Test Site is also located at 6600 Congress Avenue, Boca Raton, Florida 33487. These sites have been found acceptable by and are on file with the FCC per FCC Registration Number 889978.

Industry Canada registration number: 3506A-1 for the test site.

\*\* Classify maximum cable lengths as  $\leq 1$  m;  $> 1$  m but  $\leq 3$  m; or  $> 3$  m

### Accessory Equipment Declaration of Conformity

All accessory equipment used during testing is commercially available off-the-shelf (COTS) FCC DoC or Verified devices.

## RF Exposure Compliance Requirements

Operating Band Center Frequency = 915 MHz

EUT Output Power = +30 dBm = 1 Watt

Antenna Gain = 6 dBi => Numeric Gain = 4

Power Density Limit for General Population is

$S = F(\text{MHz}) / 1500 = 0.61 \text{ mW} / \text{cm}^2$  or  $6100 \text{ W/m}^2$

(CFR 47 Part 1.1310, Table 1)

**Minimum MPE safe distance (using equation below) = 7 mm**

Calculations: from OET-65, equation 3)

Assuming 1 watt output power into a maximum 6 dBi gain antenna, neglecting for cable losses to the antenna gives a 4 watt total output.

Power Density  $P_d = (P_t * G) / (4 * \pi * d^2)$

$P_d = (1 \text{ watt} * 4 \text{ gain}) / (4 * \pi * 0.25^2)$  at 25 cm distance

$P_d = (4) / (0.785) = 5.1 \text{ W/m}^2$  where limit is  $6100 \text{ W/m}^2$

Or to find the safe distance that meets the MPE limit;

Power Density  $P_d = (P_t * G) / (4 * \pi * d^2)$

Solve for d, the minimum safe distance to meet the MPE limit.

$d^2 = (P_t * G) / (4 * \pi * P_d)$

$d = \text{SqrRoot}((P_t * G) / (4 * \pi * P_d))$

$d = \text{SqrRoot}((1 \text{ watt} * 4 \text{ gain}) / (4 * \pi * 6100 \text{ watt/m}^2))$

$d = \text{SqrRoot}((4 / 4 * \pi * 6100) \text{m}^2)$

$d = \text{SqrRoot}(1 / \pi * 6100) \text{m}$

$d = 0.007 \text{ meters} = 7 \text{ mm}$

Where

E = Field Strength in Volts/meter

$P_t$  = Transmit Power to the antenna in Watts

G = Numeric Antenna Gain

d = Distance in Meters

$P_d$  = Power Density in W / square m

## INPUT VOLTAGE VARIATION, 15.31(e)

Measured using a connector adapter short cable, MCX to N.  
The required cable is longer and has more loss.

<u>Frequency</u>	<u>Voltage</u>	<u>Peak Signal Level</u>
902.74	120	30.00 dBm

## **FREQUENCY HOPPING REQUIREMENT, 15.247**

### Section 15.247 (a)

The EUT contains a transmitter that modulates a carrier with data, changes carrier frequency in a pseudo-random pattern with a dwell time, channel separation, and hop count that meets the requirements of 15.247.

In addition, the receiver tracks the transmitter's pseudo-random hopping sequence and demodulates the signal.

The order of channels in the hop sequence is pseudo random list.

Frequency-hopping proceeds in order through the list.

### Equal Hopping Frequency Use [Section 15.247 (g)]

Each Frequency is specified only once in the list and the list is completed before looping back to the beginning.

### System Receiver Input Bandwidth

The received signal is demodulated by a balanced mixer. The output of this mixer is filter by a fixed 5 MHz low pass 5th order anti-aliasing filter. The output of the anti-aliasing filter is sampled by the ADC – where the samples are passed to the DSP for selective filtering. Depending on the protocol used, the signal is further digitally filtered (by the DSP) as required by the tag protocol.

### System Receiver Hopping Capability

Each RF radio module carrier starts from a Synthesizer with an 8 MHz input clock. The synthesizer output (carrier) is passed through a preliminary RF chain of filters and pre-amplifiers. Through a power splitter, the Carrier is sent into two directions—one for the transmit path and the other for the receive path. Through the transmit path, the carrier is further filtered and amplified before passing through an isolator before passing through a 4 port switch—where the signal can be multiplexed onto one of four external antenna ports. The portion of the transmitter split off into the receive path is used to demodulate the received signal from the selected output port—thereby assuring that the demodulation reference is exactly equal to the transmit carrier frequency. The carrier may hop to one of 50 different frequencies and the receive path will always be in synchronization with it.

### Section 15.247 (h)

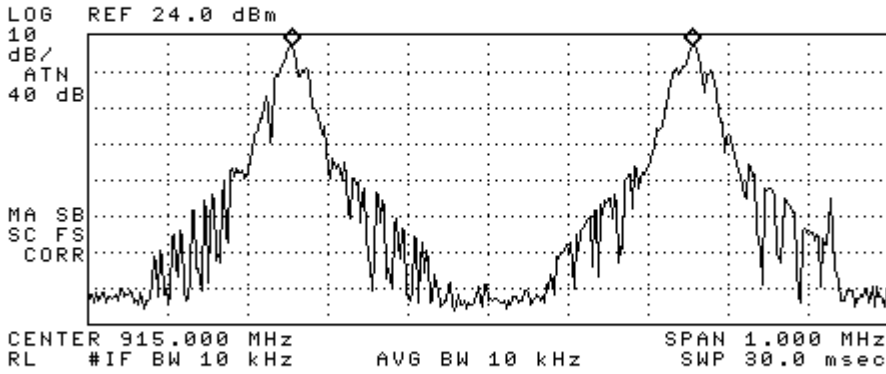

Since the device is programmed to follow a set hopping sequence, regardless of potential interference and it is not programmed to scan the channels for interference, it does not have the ability to coordinate with other FHSS systems in an effort to avoid the simultaneous occupancy of individual frequencies.

## PEAK POWER OUTPUT, 15.247 (b)

On the transmitter ports, the maximum output power is set at 30 dBm.

The worst case peak conducted power is reported here and is measured at 19.88 dBm. A 10 dB attenuator was used to prevent damage to the spectrum analyzer front end and the loss was measured at 9.8 dB. The short connecting cable loss is 0.4 dB.

Therefore, the peak power is 20.12 dBm + 9.8 dBm = 29.92 dBm or 1 Watt.

The EUT complies with the limit.

The intended use for the EUT is detection of nearby tags. Therefore, maximum output of 30 dBm is not needed at the antennas.

Cable loss provides acceptable performance for detecting tags. Thus there is no need to define cable parameters to meet the limit.

# BAND-EDGE COMPLIANCE OF RF CONDUCTED EMISSIONS, 15.247 (c)

Limit: > 20 dB below highest in band signal.

Low side, non-hopping and hopping respectively. Band edge is 902 MHz; emissions are more than 30 dB below the in band signal.

High side, non-hopping and hopping respectively. Band edge is 928 MHz; emissions are more than 30 dB below the in band signal.

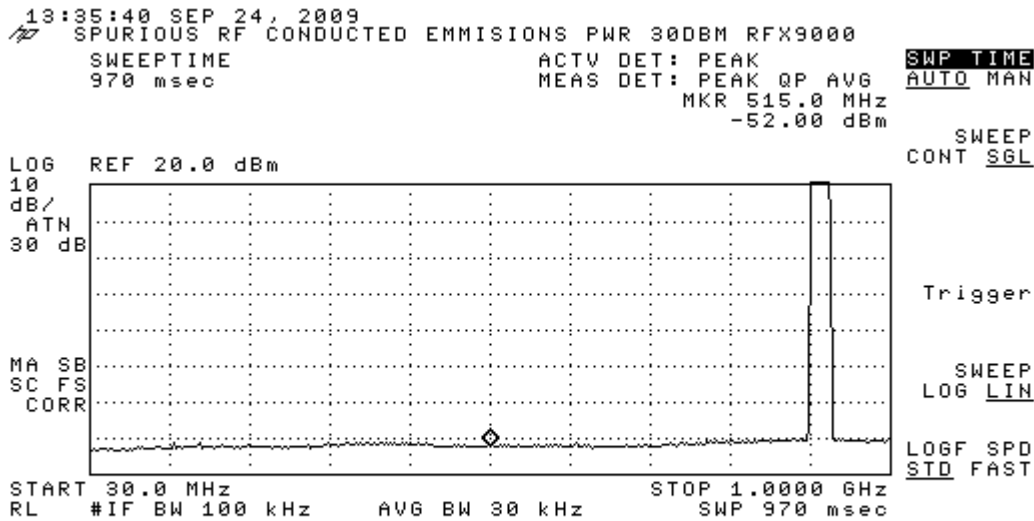

Setup:

## SPURIOUS RF CONDUCTED EMISSIONS, 15.247 (c)

The following plots show that there are no emissions within 20 dB of the in band signal in any 100 kHz band from 30 MHz all the way to the 10th harmonic.

Maximum output power, below 1 GHz

Minimum output power, below 1 GHz

Setup:

Maximum output power, above 1 GHz

# SPURIOUS RADIATED EMISSIONS, 15.247 (c), 15.205, 15.209

The EUT was prescreened in the semi-anechoic chamber at Sensormatic per the guidelines in ANSI C63.4-1992. Each port was compared to determine which had the worst case emissions.

In addition, each antenna type was compared in prescreens to determine the worst case antenna for measurement.

Pre-compliance scans in chamber.

916 MHz Harmonics identified in pre-compliance chamber

	Freq (MHz)	dBuV	Antenna	Polarization	ant fac	Cable fac	900 MHz hpf	MiteQ	Corrected
Avg	1831	47.77	EMCO Horn	Vert	25.067	8.4	0.389	-29	52.626
Avg	1831	45.13	EMCO Horn	Horz	25.087	8.4	0.389	-29	50.006

2<sup>nd</sup> Harmonic – 1.831 GHz measured on OATS

	Freq (MHz)	dBuV	Antenna	Polarization	ant fac	Cable fac	900 MHz hpf	MiteQ	Corrected
Avg	1831	54.1	EMCO Horn	Vert	25.067	1.5	0.389	-29	52.056

FCC Limit is 54 dBuV

Fundamental is below cutoff for high pass filter and is suppressed to prevent front end overload of SA while measuring harmonics.

Fundamental at left. 2<sup>nd</sup> Harmonic near center. No 3<sup>rd</sup> or higher harmonics detected.

## TX Spurious Emissions below 1 GHz

Radiated transmitter spurious emissions below were prescreened in the anechoic chamber below 1 GHz by turning the transmitter on and off. The emissions that were there when the transmitter was on were classified as transmitter spurious.

The rest were considered unintentional digital emissions, results in the next section.  
This was done on the lo / mid / and high channels with the same result.

There were no discernable spurious emissions below 1 GHz that tracked with the transmitter.

## Test Equipment List

Description	Manufacturer	Model	Serial #	Due	Last
Antenna Bicon	EMCO	3104C	4334	4/3/2010	4/3/2009
Antenna BiLog (Immunity)	Schaffner Chase	CBL6141	4112	verify	
Antenna Double-Ridge Horn	EMCO	3115	3006	4/2/2010	4/2/2009
Antenna Log Periodic	EMCO	3146	4731	5/4/2010	5/4/2009
Antenna Log Periodic	EMCO	3146	3576	4/3/2010	4/3/2009
Antenna Log Periodic	EMCO	3146	3909	5/4/2010	5/4/2009
