Application for FCC Certification
Regenerative Digital Television Translator

Power Measurements

The translator's power meter circuit uses a detected sample from a coupler on the output. An averaging detector circuit provides the DC level to drive the translator's output level meter.

The translator was connected to a test load through a calibrated directional coupler. The spectrum analyzer's "Channel Power" function was used to measure the average power level of the signal as sampled through the directional coupler. (see Fig.)

Measured power: 6.9dBm

Coupling/cable loss: 53.1dB

Power: 60.0dBm

Power = 1000 Watts
