Microsoft EMC Laboratory attests that the product model identified in this report has been tested to and meets the requirements identified in the above standards. The test results in this report solely pertains to the specific sample tested, under the conditions and operating modes as provided by the customer.

This report shall not be used to claim product certification, approval, or endorsement by A2LA or any agency of any Government. Reproduction, duplication or publication of extracts from this test report is prohibited and requires prior written approval of Microsoft EMC Laboratory.

2 Deviations from Standards

None.

3 Facilities and Accreditations

3.1 Test Facility

All test facilities used to collect the test data are located at Microsoft EMC Laboratory,
17760 NE 67th Ct,
Redmond WA, 98052, USA

3.2 Accreditations

The lab is established and follows procedures as outlined in IEC/ISO 17025 and A2LA accreditation requirements.

A2LA Accredited Testing Certificate Number: 3472.01

FCC Registration Number: US1141

IC Site Registration Numbers: 3048A-1, 3048A-2, 3048A-3, 3048A-4

3.3 Test Equipment

The site and related equipment are constructed in conformance with the requirements of ANSI C63.4, CISPR 16-1-1 and other equivalent applicable standards. Test site requirements for measurements above 1 GHz are in accordance with ANSI C63.4:2009. ANSI C63.10:2013 and the appropriate KDB test methods were followed.

The calibrations of the measuring instruments, including any accessories that may affect such calibration, are checked frequently to assure their accuracy. Adjustments are made and correction factors applied in accordance with instructions contained in the user manual for the measuring equipment.

4 Measurement Uncertainty

The following measurement uncertainty levels have been estimated for tests performed on the product, as specified in CISPR 16-4-2. This represents an expanded uncertainty expressed at 95% confidence level using a coverage factor $k=2$.

Expanded uncertainty calculations are available upon request.

Test item	Value (dB)
Radiated disturbance (30 MHz to 1 GHz)	6.01
Radiated disturbance (1 GHz to 18 GHz)	4.80

5 Product Description

Company Name:	Microsoft Corporation
Address:	One Microsoft Way
City, State, Zip:	Redmond, WA 98052-6399
Customer Contact:	Sahithi Kandula
Functional Description of the EUT:	Wireless input accessory device
Model:	1710
FCC ID:	C3K1710
IC ID:	3048A-1710
Radio Description:	BT LE (2402- 2480 MHz)
Modulation:	GFSK
Antenna Type and Gain:	Internal -2.41 dBi Gain
EUT Classification:	DTS
Equipment Design State:	EV2/Production
Equipment Condition:	Good
Test Sample Details:	SN: R-188-061715-05 - Conducted SN: 0007061521574 - Radiated

5.1 Test Configurations

The EUT was preprogrammed to transmit continuously in GFSK mode. Channel numbers 0, 19 and 39 are used as the Low/Mid/High channels of test.

When in Low energy mode operation, the Bluetooth transmitter hops pseudo-randomly between 40 channels, three of which are “advertising channels”. Operation on the advertising channels does not qualify the EUT as a FHSS, and so the EUT is certified as a DTS device. The data shown in this report reflects the device when it transmits on its advertising channels.

5.2 Environmental Conditions

Ambient air temperature of the test site was within the range of 10 °C to 40 °C (50 °F to 104 °F) unless the EUT specified testing over a different temperature range. Humidity levels were in the range of 10% to 90% relative humidity. Testing conditions were within tolerance and any deviations required from the EUT are reported.

5.3 Antenna Requirements

The antennas are permanently attached and there are no provisions for connection to an external antenna.

5.4 Equipment Modifications

No modifications were made during testing.

5.5 Dates of Testing

Testing was performed on June 19th – 23rd, July 10th and July 16th 2015.

8 Test Site Description

8.1 Radiated Emissions Test Site

Radiated measurements were performed in a 3m semi-anechoic chamber, which fully meets NSA requirements for the frequency range of 30MHz to 1000MHz.

An antenna mast is used to adjust the height of the measurement antenna and a turntable is used to adjust the EUT azimuth. A non-conducting 1m x 1.5m x 80cm table was installed on the turntable to support the EUT. For measurements below 1 GHz, the antenna height was varied from 1 meter to 4 meters and the turn table rotated 360 degrees to determine the highest emissions.

Measurements above 1 GHz were performed with a device positioner, which supported the EUT 150 cm above the ground plane. The measurement antenna remained fixed at 150 cm while the device positioner and turntable rotated the EUT about its orthogonal axis to investigate emissions. A 2.4m x 2.4m absorber configuration was used for measurements from 1 to 18 GHz in accordance with ANSI C63.4:2009.

The EUT and its support equipment were exercised and cabling manipulated to maximize each emission.

For radiated measurements below 1GHz, linearly polarized broadband antennas were used. Radiated emissions above 1GHz were performed using horn antennas.

8.2 Antenna port conducted measurements

All antenna port conducted measurements were performed on a bench-top setup consisting of a spectrum analyzer, power meter (as necessary), splitters/combiners (as necessary), attenuators, and pre-characterized RF cables.

The correction factors between the EUT and the Spectrum Analyzer is added internally in the Analyzer settings. The plots displayed accounts for these correction factors.

9.1 6-dB Bandwidth

9.1.1 Test Requirement:

FCC CFR 47 Rule Part 15.247 (a)(2)

Industry Canada RSS-247 [5.2]

9.1.2 Test Method:

Measurements were performed according to the procedure defined in KDB 558074- Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247 V03R02 and ANSI C63.10 2013.

Spectrum Analyzer settings:

RBW= 100 kHz

VBW= 300 kHz

Trace Mode= Peak Detector (Max Hold)

Sweep time= Auto

The in-built functionality of the Spectrum Analyzer is used to measure the 6-dB bandwidth.

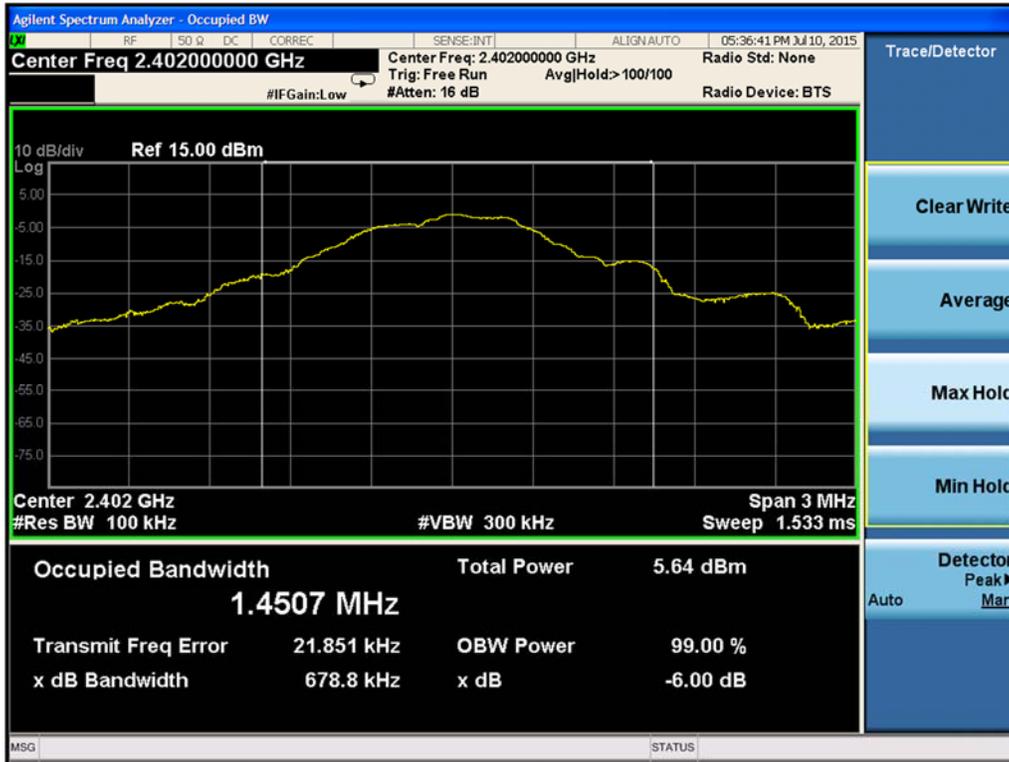

9.1.3 Limits:

The 6-dB bandwidth shall be at least 500 kHz

9.6 Radiated Spurious and Band Edge Emissions

9.6.1 Test Requirement:

FCC CFR 47 Rule Part 15.247 (d)

Industry Canada RSS-247 [5.5] and RSS GEN [8.9]

9.6.2 Test Method:

Measurements were performed according to the procedure defined in KDB 558074- Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247 V03R02 and ANSI C63.10 2013.

Radiated spurious measurements were made from 30MHz to the 10th harmonic of the fundamental frequency of the transmitter. The limit for radiated spurious emissions is per 15.209 and RSS-Gen. Additionally, emissions found in the restricted bands as listed in 15.205 were tested for compliance per limits 15.209.

The EUT was tested near the low, middle and high channels of operation. Guidelines in ANSI C63.10 2013 were followed with respect to maximizing the emission by rotating the EUT about its vertical and horizontal axis and adjusting the measurement antenna polarization. Worst case maximized data is shown in this test report.

A pre-amp and a high pass filter were required for this test, in order to provide the measuring system with sufficient sensitivity. The peak reading of the emission, after being corrected by the antenna factor, cable loss, pre-amp gain, etc., is the peak field strength.

Sample Calculation:

Field Strength Level: Amplitude (Analyzer level) + AFCL (Antenna Factor and Cable losses) – Amplifier Gain = 50 dB μ V + 33 dB – 25 dB = 78dB μ V/m

Spectrum Analyzer Settings:
