UL LLC tested the above equipment in accordance with the requirements set forth in the above standards. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.

The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. All samples tested were in good operating condition throughout the entire test program. Measurement Uncertainties are published for informational purposes only and were not taken into account unless noted otherwise.

This document may not be altered or revised in any way unless done so by UL LLC and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL LLC will constitute fraud and shall nullify the document.

# 2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with the Contention Based Protocol portion of

- FCC 47 CFR Part 15 Subpart E
- FCC KDB 987594 D01 U-NII 6GHz General Requirements v02r02
- FCC KDB 987594 D02 U-NII 6GHz EMC Measurement v02r01
- RSS-248 Issue 2

# 3. SUMMARY OF TEST RESULTS

Requirement Description	Result	Remarks

47 CFR PART 15 SUBPART E, KDB 987594	-	
Contention Based Protocol Portion of RSS-	Complies	
248, Issue 2	-	

Channel puncturing and Channel bandwidth reduction: Supported, please refer to section 7.2.5 in the report confirming this.

# 4. REFERENCE DOCUMENTS

Measurements of transmitter parameters as referenced in this report and all other manufacturer's declarations relevant to the RF test requirements are documented in UL LLC report number R14932101-E10a.

This report contains data provided by the customer which can impact the validity of results. UL LLC is only responsible for the validity of results after the integration of the data provided by the customer.

Below is a list of the data provided by the customer:

1. Antenna gain and type (see section 7.2.5)

# 5. FACILITIES AND ACCREDITATION

UL LLC is accredited by A2LA, certification # 0751.06, for all testing performed within the scope of this report. Testing was performed at the locations noted below.

# 6. DECISION RULES AND MEASUREMENT UNCERTAINTY

# 6.1. METROLOGICAL TRACEABILITY

All test and measuring equipment utilized to perform the tests documented in this report are calibrated on a regular basis, with a maximum time between calibrations of one year or the manufacturers' recommendation, whichever is less, and where applicable is traceable to recognized national standards.

### 6.2. DECISION RULES

The Decision Rule is based on Simple Acceptance in accordance with ISO Guide 98-4:2012 Clause 8.2. (Measurement uncertainty is not taken into account when stating conformity with a specified requirement).

# 6.3. MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

PARAMETER	$U_Lab$
Radio Frequency (Spectrum Analyzer)	141.16 Hz
Occupied Bandwidth	1.22%
Power Spectral Density	2.47 dB
RF Power Measurement Direct Method Using Power Meter	1.3 dB (PK) / 0.45 dB (AV)
Unwanted Emissions, Conducted	1.94 dB
Worst Case Conducted Disturbance, 9kHz to 0.15 MHz	3.78 dB
Worst Case Conducted Disturbance, 0.15 to 30 MHz	3.40 dB
Worst Case Radiated Disturbance, 9kHz to 30 MHz	2.87 dB
Worst Case Radiated Disturbance, 30 to 1000 MHz	6.01 dB
Worst Case Radiated Disturbance, 1000 to 18000 MHz	4.73 dB
Worst Case Radiated Disturbance, 18000 to 26000 MHz	4.51 dB
Worst Case Radiated Disturbance, 26000 to 40000 MHz	5.29 dB
Time Domain Measurements	0.02 %
Temperature	0.57°C
Humidity	3.39%
DC Supply Voltages	0.57%

Uncertainty figures are valid to a confidence level of 95%.

# 7.2. DESCRIPTION OF TEST SETUP

# 7.2.1. TEST AND MEASUREMENT SYSTEM

These tests were performed using a Conducted instrument configuration.

# **CONDUCTED TEST CONFIGURATION**

**NOTE:** This is a comprehensive setup diagram of the receiver performance test and measurement system. Not all of the devices shown below are used for every applicable receiver test. Also, coupler port designations "IN" and "OUT" refer to labeling on the coupler, not the RF signal flow.

DATE: 2024-04-16

REPORT NO: R14932101-C1a DATE: 2024-04-16 FCC ID: C3K2036 IC: 3048A-2036

# **SYSTEM OVERVIEW**

Should multiple RF ports be utilized for the EUT and/or Companion devices (for example, for diversity or MIMO implementations), combiner/dividers are inserted between the EUT MIMO Combiner/Divider, and the attenuator connected to the EUT (and/or between the Companion MIMO Combiner/Divider and the attenuator connected to the Companion Device). Additional attenuators may be utilized such that there is one attenuator at each RF port on each device.

#### **SYSTEM CALIBRATION**

The monitoring cable is disconnected from the spectrum analyzer and a 50-ohm load is connected to the end of the monitoring cable in place of the spectrum analyzer. The cable connected to the EUT's antenna port is then attached to the spectrum analyzer in place of the monitoring cable. In such cases where a combiner/divider is used, a single cable is disconnected from one of the EUT's antenna ports and connected to the spectrum analyzer; all other cables are disconnected from the antenna ports and terminated with a 50-ohm load. A signal generator is then set to produce a modulated AWGN Incumbent Signal that has a 99% occupied power bandwidth of 10 MHz. The output amplitude of the signal generator is adjusted to yield the allowable maximum AWGN Incumbent Signal level as measured on the spectrum analyzer. The EUT and monitoring cables are then returned to their original configurations to perform the test.

#### **TEST AND MEASUREMENT EQUIPMENT**

The following test and measurement equipment was utilized for the tests documented in this report:

TEST EQUIPMENT LIST							
Description	Model	ID No.	Cal Due				
Spectrum Analyzer, PXA, 3Hz to 8.4GHz	Keysight	N9030A	89232	2024-08-02			
Signal Generator, MXG X-Series RF Vector	Keysight	N5182B	215042	2024-01-31			
Frequency Extender	Keysight	N5182BX	215272	2024-01-31			

**Note:** An MXG series Signal Generator and separate external Frequency Extender module are shown in the preceding test system block diagram as a stand-alone Incumbent Signal Generator.

REPORT NO: R14932101-C1a DATE: 2024-04-16 FCC ID: C3K2036 IC: 3048A-2036

# 7.2.2. TEST AND MEASUREMENT SOFTWARE

The following test and measurement software was utilized for the tests documented in this report:

TEST SOFTWARE LIST				
Name Version Test / Function				
PXA Read	3.1	Signal Generator Screen Capture		

7.2.3. TEST ROOM ENVIRONMENT

The test room temperature and humidity are as follows:

# **ENVIRONMENT CONDITION**

Parameter	Value	
Temperature	21.1 – 24.9 °C	
Humidity	16 – 55 %	

# 7.2.4. SETUP OF EUT

# **CONDUCTED METHOD EUT TEST SETUP**

# **SUPPORT EQUIPMENT**

The following support equipment was utilized for the tests documented in this report:

PERIPHERAL SUPPORT EQUIPMENT LIST

DATE: 2024-04-16

REPORT NO: R14932101-C1a FCC ID: C3K2036

# 7.2.5. DESCRIPTION OF EUT

The EUT operates in the following bands: U-NII 5 (5925 MHz-6425 MHz), U-NII 6 (6425 MHz-6525 MHz), U-NII 7 (6525 MHz-6875 MHz) and U-NII 8 (6875 MHz-7125 MHz).

DATE: 2024-04-16

IC: 3048A-2036

The EUT is classified as a 6 GHz Dual Client Device.

The lowest gain antenna assembly utilized with the EUT has a gain of 5.73 dBi in the U-NII 5 band, 5.56 dBi in the U-NII 6 band, 5.56 dBi in the U-NII 7 band and 4.80 dBi in the U-NII 8 band.

The calibrated conducted AWGN Incumbent Detection Threshold level is set to –62 dBm. The tested level is lower than the maximum allowable level hence it provides a margin to the limit.

Two identical antennas are utilized to meet the diversity and MIMO operational requirements.

The EUT uses two transmitter/receiver chains, each connected to a 50-ohm coaxial antenna port. All antenna ports are connected to the test system via a power divider to perform conducted tests.

This device supports channel puncturing but it is only used for network performance improvements. When the contention based protocol detects an incumbent signal within the channel, transmissions are stopped across the entire channel, punctured or not, except when employing a reduced channel bandwidth as described below.

Contention-Based Protocol for 6GHz is supported by a channel reduction mechanism. Channel reduction occurs for both 320MHz and 160MHz bandwidths. Channels with a 320MHz bandwidth have the capability to reduce the bandwidth to 160MHz and 80MHz. Channels with a 160MHz bandwidth have the capacity to reduce the bandwidth to 80MHz and 40MHz. The channel bandwidth reduction allows for the preferred channel to be maintained while avoiding the incumbent.

WLAN traffic was generated by transferring a data stream from the EUT to the Companion Device using iPerf version 3.0.10 software package.

The EUT utilizes the 802.11be architecture. Five nominal channel bandwidths are implemented: 20 MHz, 40 MHz, 80 MHz, 160 and 320 MHz.

The software installed in the EUT is 1.0.3808.9500.

The software installed in the Companion Device is 3.0.0.6.102 32882.

#### **TEST SETUP**

The EUT is linked to a companion 802.11 wireless radio device. A commercial traffic generation program (iPerf) was utilized to generate traffic from the EUT to the companion radio device.

REPORT NO: R14932101-C1a DATE: 2024-04-16 FCC ID: C3K2036 IC: 3048A-2036

# 8. CONTENTION BASED PROTOCOL

# 8.1. LIMITS AND PROCEDURES

### **LIMITS**

FCC Part 15 Subpart E, FCC KDB 987594 "U-NII 6 GHz devices operating in the 5.925-7.125 GHz band"; Section I.

### **AWGN INCUMBENT SIGNAL DETECTION THRESHOLD**

FCC Part 15 Subpart E, FCC KDB 987594 "U-NII 6 GHz devices operating in the 5.925-7.125 GHz band"; Section I, Clause (c), Step 6.

For an EUT with a non-zero dBi antenna gain the maximum detection threshold level, T<sub>L</sub>, of the 10 MHz wide AWGN Incumbent Signal at the port of the radio module in a conducted test setup shall be no greater than -62 dBm/MHz. It shall be adjusted by the gain of the bypassed antenna as shown in the table below:

	Frequency Range Antenna		T <sub>L</sub> at Radio Port	
Band	(MHz)	Gain (dBi)	(dBm/MHz)	
U-NII 5	5925 to 6425	5.73	-56.27	
U-NII 6	6425 to 6525	5.56	-56.44	
U-NII 7	6525 to 6875	5.56	-56.44	
U-NII 8	6875 to 7125	4.80	-57.2	

#### **TEST PROCEDURE**

FCC Part 15 Subpart E, FCC KDB 987594 "U-NII 6 GHz devices operating in the 5.925-7.125 GHz band"; Section I, Clause (c).

This test was performed by starting at a signal level significantly lower than the required minimum detection level and then slowly increasing the signal level until the required detection requirements were met.

# 8.2. U-NII 5 BAND TEST CONDITION 1 RESULTS

### **TEST CONDITION 1 CRITERIA**

99% BW<sub>EUT</sub> ≤ 99% BW<sub>INC</sub>

DATE: 2024-04-16

IC: 3048A-2036

The lowest and highest supported channel bandwidths do not meet the criteria for this test condition therefore this test was not performed.

# 8.3. U-NII 5 BAND TEST CONDITION 2 RESULTS

# **TEST CONDITION 2 CRITERIA**

99% BW<sub>INC</sub> < 99% BW<sub>EUT</sub> ≤ 2 x 99% BW<sub>INC</sub>

### 8.3.1. TEST CHANNEL

All tests were performed with the EUT set to a channel center frequency of 6215 MHz and a nominal channel bandwidth of 20 MHz.

Only the lowest and highest supported channel bandwidths are required to be tested.

# 8.3.2. INCUMBENT SIGNAL PLOTS

All tests were performed with the Incumbent Signal frequency set to the test channel center frequency and a nominal 99% Occupied Power Bandwidth of 10 MHz.

### **INCUMBENT SIGNAL 99% OCCUPIED POWER BANDWIDTH**

# MINIMUM PASSING INCUMBENT SIGNAL POWER

The signal power was measured at the output of the incumbent signal generator, and a correction was applied for the known path loss of the system.

DATE: 2024-04-16

# 8.3.3. EUT TRANSMISSION PLOTS

# **EUT 99% OCCUPIED POWER BANDWIDTH**

DATE: 2024-04-16

# TRAFFIC WITHOUT THE INCUMBENT SIGNAL PRESENT

### **EUT RESPONSE TO THE APPLIED INCUMBENT SIGNAL**

A link between the EUT and the Companion Device was established on the test channel. Traffic flowing from the EUT to the Companion Device was then initiated. A sweep was started and the incumbent signal was continuously applied at approximately 6 seconds after the start of the sweep for a duration of 10 seconds and removed after the end of the observation period. Markers are placed at the beginning and end of the observation period.

Transmissions cease while the Incumbent AWGN Signal is present and resume after it is removed.

# 8.3.4. TABULATED TEST RESULTS

### 8.5.1. TEST CHANNEL

All tests were performed with the EUT set to a channel center frequency of 6105 MHz and a nominal channel bandwidth of 320 MHz.

Only the lowest and highest supported channel bandwidths are required to be tested.

# 8.5.2. INCUMBENT SIGNAL PLOTS

All tests were performed with the Incumbent Signal frequency set to the test channel center frequency and a nominal 99% Occupied Power Bandwidth of 10 MHz.

Transmissions cease while the Incumbent AWGN Signal is present and resume after it is removed.

DATE: 2024-04-16

### **EUT BANDWIDTH REDUCTION**

The EUT is allowed to continue operating at a reduced bandwidth in the presence of the Incumbent Signal, so long as the EUT transmissions do not overlap with the channel used by the Incumbent Signal.

With the Incumbent Signal set to the Lower Edge  $f_{c2}$  the EUT continues to operate at a reduced 160MHz bandwidth.

# TRAFFIC WITHOUT THE INCUMBENT SIGNAL PRESENT

# Lower Edge f<sub>c2</sub>:

DATE: 2024-04-16

# Center Frequency fc1:

DATE: 2024-04-16

# Upper Edge f<sub>c3</sub>:

DATE: 2024-04-16

### **EUT RESPONSE TO THE APPLIED INCUMBENT SIGNAL**

A link between the EUT and the Companion Device was established on the test channel. Traffic flowing from the EUT to the Companion Device was then initiated. A sweep was started and the incumbent signal was continuously applied at approximately 6 seconds after the start of the sweep for a duration of 10 seconds and removed after the end of the observation period. Markers are placed at the beginning and end of the observation period.

### Lower Edge Incumbent Signal fc2:

Transmissions cease while the Incumbent AWGN Signal is present and resume after it is removed.

# Center Frequency Incumbent Signal fc1:

Transmissions cease while the Incumbent AWGN Signal is present and resume after it is removed.

DATE: 2024-04-16

# Upper Edge Incumbent Signal fc3:

Transmissions cease while the Incumbent AWGN Signal is present and resume after it is removed.

DATE: 2024-04-16

# **EUT BANDWIDTH REDUCTION**

The EUT is allowed to continue operating at a reduced bandwidth in the presence of the Incumbent Signal, so long as the EUT transmissions do not overlap with the channel used by the Incumbent Signal.

With the Incumbent Signal set to the Lower Edge  $f_{c2}$  the EUT continues to operate at a reduced 80MHz bandwidth.

DATE: 2024-04-16 IC: 3048A-2036

### 8.13.4. TABULATED TEST RESULTS

# **INCUMBENT SIGNAL DETECTION RESULTS**

EUT Channel Center Frequency, f <sub>c1</sub> (MHz)	6745
EUT Nominal Channel Bandwidth (MHz)	320
99% Occupied Bandwidth of the EUT (MHz)	314.21
EUT 99% OBW Lower Edge, F <sub>L</sub> (MHz)	6587.90
EUT 99% OBW Upper Edge, F <sub>H</sub> (MHz)	6902.11
99% Occupied Bandwidth of the Incumbent Signal (MHz)	10.087
Test Frequency of Incumbent Signal (f <sub>c2</sub> ) Near EUT F <sub>L</sub> (MHz)	6593
Test Frequency of Incumbent Signal at f <sub>c1</sub> (MHz)	6745
