

According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance  $\leq 50$  mm are determined by:

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] * [f(\text{GHz})] \leq 3.0$

The tune-up power is 4 dBm +/- 2dB, therefore the highest tune-up power is 2.83 dBm (1.92 mW) @ 2402 MHz

When the minimum *test separation distance* is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So,

$(1.92\text{mW} / 5\text{mm}) * (2.402\text{GHz}^{0.5}) = 0.6$

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] * [f(\text{GHz})] = 0.6 < 3.0$

Therefore, standalone SAR measurements are not required for both head and body.
