**Radiated spurious emissions:**

**30 – 1000 MHz**

All operating modes were investigated and observed to have similar emissions characteristics. Data for the worst case operating mode (all 4 transmitters operating at full power, MID channel, 20 MHz operating bandwidth, GFSK modulation) is presented below. Preliminary scans were performed with a peak detector to identify suspect frequencies. Identified suspect frequencies were maximized with respect to azimuth, measurement antenna height and polarization and measured with an RMS detector with a 1 MHz resolution bandwidth.

Full Spectrum

**Figure 8.8-1:** Radiated emissions spectral plot (30 MHz - 1 GHz), MID channel, 20 MHz bandwidth, GFSK modulation

**Table 8.8-1:** Radiated emissions results, MID channel, 20 MHz bandwidth, GFSK modulation

Frequency (MHz)	RMS (dBµV/m)	Limit (dBµV/m)	Margin (dB)	Meas. Time (ms)	Bandwidth (kHz)	Height (cm)	Pol	Azimuth (deg)	Corr. (dB/m)
54.268000	35.04	55.23	20.19	5000.0	1000.000	114.0	V	275.0	14.2
164.183000	30.05	55.23	25.18	5000.0	1000.000	100.0	V	145.0	18.5
320.681000	28.59	55.23	26.64	5000.0	1000.000	292.0	H	146.0	22.6

Notes: <sup>1</sup> Field strength (dB V/m) = receiver/spectrum analyzer value (dB V) + correction factor (dB)  
<sup>2</sup> Correction factors = antenna factor ACF (dB) + cable loss (dB)  
<sup>3</sup> Emissions that were continuously present for a minimum of 1 second and occurred more than once for every 15 seconds observation period were considered valid emissions. The maximum value of valid emissions has been recorded.

**1 – 18 GHz:**

All operating modes were investigated and observed to have similar emissions characteristics. Data for the worst case operating modes (all 4 transmitters operating at full power, LOW, MID and HIGH channel, 10 and 20 MHz operating bandwidth, GFSK modulation) is presented below. Three channels (LOW, MID and HIGH) are presented to verify performance in the vicinity of the operating band. Preliminary scans to were performed with a peak detector to identify suspect frequencies. Identified suspect frequencies were maximized with respect to azimuth, measurement antenna height and polarization and measured with an RMS detector with a 1 MHz resolution bandwidth.

**18 – 26.5 GHz**

All operating modes were investigated and observed to no significant emissions. Data from a representative operating mode (all 4 transmitters operating at full power, MID channel, 20 MHz operating bandwidth, GFSK modulation) is presented below. Preliminary scans to were performed with a peak detector to identify suspect frequencies. Identified suspect frequencies were maximized with respect to azimuth, measurement antenna height and polarization and measured with an RMS detector with a 1 MHz resolution bandwidth.

26493.831250	28.24	55.23	26.99	5000.0	1000.000	400.0	V	151.0	23.4

Notes: <sup>1</sup> Field strength (dB V/m) = receiver/spectrum analyzer value (dB V) + correction factor (dB)  
<sup>2</sup> Correction factors = antenna factor ACF (dB) + cable loss (dB)  
<sup>3</sup> Emissions that were continuously present for a minimum of 1 second and occurred more than once for every 15 seconds observation period were considered valid emissions. The maximum value of valid emissions has been recorded.

26.5 – 40 GHz

All operating modes were investigated and observed to no significant emissions. Data from a representative operating mode (all 4 transmitters operating at full power, MID channel, 20 MHz operating bandwidth, GFSK modulation) is presented below. Preliminary scans to were performed with a peak detector to identify suspect frequencies. Identified suspect frequencies were maximized with respect to azimuth, measurement antenna height and polarization and measured with an RMS detector with a 1 MHz resolution bandwidth.
