1 Introduction and Conclusion

The tests indicated below were performed on the product described in section 5. The remaining test sections are the verbatim text from the actual data sheets used during the investigation. No additions, deviations, or exclusions have been made from the standard(s) unless specifically noted.

Based on the results of our investigation, we have concluded the product tested **complies** with the requirements of the standard(s) indicated. The results obtained in this test report pertain only to the item(s) tested. Intertek does not make any claims of compliance for samples or variants which were not tested.

5 Description of Equipment under Test and Variant Models

Equipment Under Test	
Product Name	Dual Band RU for North America
Model Number	DB 5G RU
Serial Number	00018
Receive Date	2/8/2021
Test Start Date	2/8/2021
Test End Date	3/5/2021
Transmit Bands Supported	N66 (2110 – 2200MHz) N70 (1995 – 2020MHz)
Modulation Types Supported	QPSK, 16QAM, 64QAM, 256QAM
Device Received Condition	Good
Test Sample Type	Production
Rated Voltage	36 – 58VDC 36.5A 1300W
Software Used By EUT	0209
Description of Equipment Under Test (provided by client)	
The product under test was the Dual Band RU for North America. It is a radio head unit supporting the 5GNR bands n66 and n70. The Dual Band RU for North America has 4 transmit ports that can operate in a correlated fashion. Photos of the device are included in a separate document.	

5.1 Variant Models:

There were no variant models covered by this evaluation.

**5.2 Supported Transmit Bands and Carrier Bandwidths (5G-NR):**

5G-NR operation was supported in bands n66 and n70 in the downlink direction only. The table below outlines the specific bandwidths supported for QPSK, 16QAM, 64QAM, and 256QAM modulations. Testing was performed on the carrier frequencies as shown in the table.

6 System Setup and Method

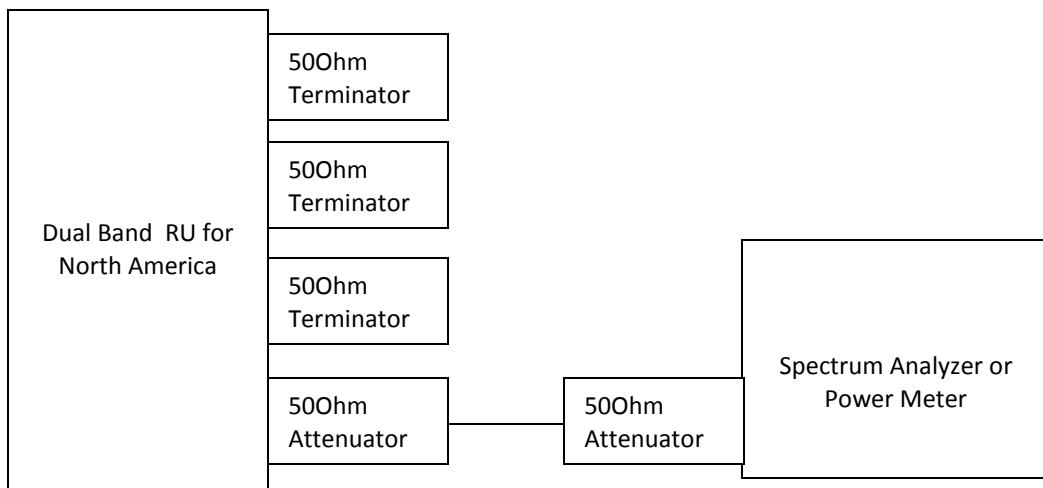

No.	Descriptions of EUT Exercising
1	A laptop computer was used to send test commands to the Dual Band RU for North America that forced it to transmit the appropriate signal. Block diagrams are shown below for the conducted and radiated setups as well as for the connections to the test jig and computer. For conducted antenna port measurements three of the ports were terminated with 100W 50 Ohm terminators. The fourth port was connected to a spectrum analyzer or power meter through appropriate attenuation to protect the measurement equipment. For the radiated tests all four antenna ports were terminated with 100W 50Ohm terminators.

7 Measurement Procedures and Determination of Worst Case Modes

The occupied bandwidth, conducted spurious emissions, frequency stability and conducted band edge measurements were all performed with the Dual Band RU for North America connected to a spectrum analyzer. Measurements were performed per the procedures outlined in ANSI C63.26: 2015. See the summary tables for specific references to the appropriate sections that were used.

The output power and peak / average power ratio measurements were performed with the Dual Band RU for North America connected to a wideband power meter. This power meter used a complementary cumulative distribution function (CCDF) for the peak / average power ratio measurements since the signals being measured were noise-like".

Frequency stability measurements were performed with the Dual Band RU for North America transmitting an unmodulated carrier wave signal which is the preferred method described in ANSI C63.26: 2015.

The four transmit ports onboard the Dual Band RU for North America were identical so all conducted measurements were performed on one port only. Pretesting was performed across all four ports and port A produced the highest output power in QPSK operation (see table below). Therefore, Port A was used for all conducted antenna port measurements.

TX Band	Modulation	BW Setting	Channel	Avg. Power (dBm) Port A	Avg. Power (dBm) Port B	Avg. Power (dBm) Port C	Avg. Power (dBm) Port D
Band 70	QPSK	5MHz	Mid	45.69	45.6	45.53	45.61
Band 66	QPSK	5MHz	Mid	46.83	46.67	46.58	46.71

Pre-Test output power study across all four conducted ports

Per KDB662911D01 for MIMO operation, a factor of $10\log_{10}(N_{\text{ant}})$ for "N" antenna ports was added to the conducted measurements in order to account for the multiple transmit ports. For 4 correlated output ports this factor was 6dB.

For conducted spurious emission measurements, testing was performed with all bandwidth and modulations supported. The worst case of these were included in the report (QPSK modulation)

For radiated spurious emission measurements, testing was performed with the bandwidth setting and modulation that produced the highest output power. The frequency spectrum was investigated from 9kHz to at least 10 times the highest frequency used or generated in the device or 40GHz (whichever was lower).
