

DUTY CYCLE CALCULATION

EXHIBIT 3-1

CFS8DL5839US-1

The 5839US-1 uses 4.5 K Baud Phase Encoded (Manchester) data, with a maximum bit cell interval of 223 uSec.

The 5839US-1 transmits a 16 bit preamble, (15 bits + one sync bit) and 96 bits of control data. For a total of 112 bits of information. the total message is 25 mSec. long.

The message is repeated five (5) times, every 120 mSec. (MIN) Therefore: the message is only sent once every 100 mSec. i.e.; $25 \text{ mSec.} / 100 \text{ mSec.} = .25$

Further the Manchester has an inherent duty cycle of 50% making the total transmitter duty cycle:
 $.25 \times .50 = .125 \times 100 = 12.5 \% \text{ total transmitter on time.}$

DUTY CYCLE CALCULATION : $25 \text{ mS} / 100 \text{ mS} = .25$,
 THUS $.25 \times 50\%$ (INHERENT IN MANCHESTER) = 12.5 % TX. DUTY CYCLE.
