Notes:

- 1) The exact method of extrapolation is  $\text{Measured SAR} \times 10^{(-\text{drift}/10)}$ . The SAR reported at the end of the measurement process by the DASY4 system can be scaled up by the Power drift to determine the SAR at the beginning of the measurement process.
- 2) The SAR measured at the middle channel for this configuration is at least 3 dB lower (0.8 mW/g) than SAR limit (1.6 mW/g), thus testing at low & high channel is optional.
- 3) Please see attachments for the detailed measurement data and plots showing the maximum SAR location of the EUT.
- 4) Collocation with CDMA Module and Bluetooth.

- 3) Please see attachments for the detailed measurement data and plots showing the maximum SAR location of the EUT.
- 4) g mode for this position is skipped since the SAR values are too close to system noise floor.

#### 8.1.4 LAP-HELD POSITION-ANTENNA ANTENNA

Based on the results from Lap-Held Main Antenna, SAR tests for this position are skipped since the SAR values are too low.

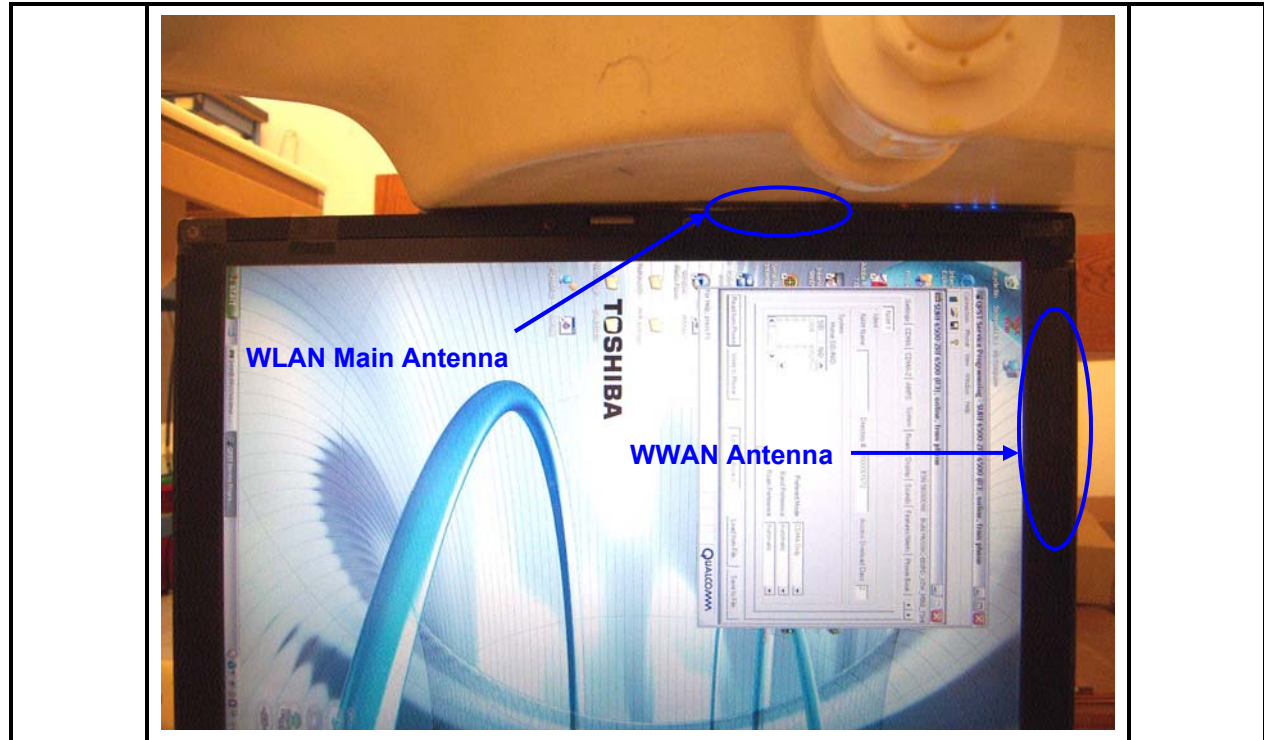

Notes:

- 1) The exact method of extrapolation is  $\text{Measured SAR} \times 10^{(-\text{drift}/10)}$ . The SAR reported at the end of the measurement process by the DASY4 system can be scaled up by the Power drift to determine the SAR at the beginning of the measurement process.
