TEST PROCEDURE

GENERAL: This report shall NOT be reproduced except in full without the written approval of TIMCO ENGINEERING, INC. The UUT was transmitting a test signal during the testing.

RADIATION INTERFERENCE: The test procedure used was ANSI STANDARD C63.4-1992 using a HEWLETT PACKARD spectrum analyzer with a preselector. The analyzer was calibrated in dB above a microvolt at the output of the antenna. The resolution bandwidth was 100 kHz and the video bandwidth was 300 kHz up to 1.0 GHz and 1.0MHz with a video BW of 3.0 MHz above 1.0 GHz. The ambient temperature of the UUT was 74°F with a humidity of 69%.

FORMULA OF CONVERSION FACTORS: The Field Strength at 3m was established by adding the meter reading of the spectrum analyzer (which is set to read in units of dBuV) to the antenna correction factor supplied by the antenna manufacturer. The antenna correction factors are stated in terms of dB. The gain of the Preselector was accounted for in the Spectrum Analyzer Meter Reading.

Example:

Freq (MHz)	METER READING + ACF = FS
33	20 dBuV + 10.36 dB = 30.36 dBuV/m @ 3m

POWER LINE CONDUCTED INTERFERENCE: The procedure used was ANSI STANDARD C63.4-1992 using a 50uH LISN. Both lines were observed. The bandwidth of the spectrum analyzer was 10 kHz with an appropriate sweep speed. The ambient temperature of the UUT was 74°F with a humidity of 69%.

ANSI STANDARD C63.4-1992 10.1.7 MEASUREMENT PROCEDURES: The UUT was placed on a table 80 cm high and with dimensions of 1m by 1.5 m. The UUT was placed in the center of the table (1.5m side). The table used for radiated measurements is capable of continuous rotation.

When an emission was found, the table was rotated to produce the maximum signal strength. At this point, the antenna was raised and lowered from 1m to 4m. The antenna was placed in both the horizontal and vertical planes.

The situation was similar for the conducted measurement except that the table did not rotate. The EUT was setup as described in ANSIC63.4-1992 with the EUT 40 cm from the vertical ground wall.

TEST PROCEDURE: ANSI STANDARD C63.4-1992 using a Hewlett Packard Model 8566B spectrum analyzer, a Hewlett Packard Model 85685A Preselector, a Hewlett Packard Model 85650A Quasi-Peak adapter, and an appropriate antenna. When an emission was found, the table was rotated to produce the maximum signal strength. The antenna was placed in both the horizontal and vertical planes and the worse case emissions were reported. The spectrum was searched to at least the tenth(10) harmonic of the fundamental.

NAME OF TEST: Occupied Bandwidth

RULES PART NO.: 15.249

REQUIREMENTS: The field strength of any emissions appearing outside the band edges and up to 10 kHz above and below the band edges shall be attenuated at least 50 dB below the level of the carrier or to the general limits of 15.249.

THE PLOTS ON THE NEXT TWO PAGES REPRESENT THE EMISSIONS TAKEN FOR THIS DEVICE.

METHOD OF MEASUREMENT: A small sample of the transmitter output was fed into the spectrum analyzer and the attached plot was printed. The vertical scale is set to -10 dBm per division. The horizontal scale is set to 100 kHz per division.

TEST RESULTS: The unit DOES meet the FCC requirements.

POWERLINE CONDUCTED LINE 2 :

MODULAR REQUIREMENTS

1. The modular transmitter must have its own RF shielding.
The unit has a shield on top of the boards, over the RF section of the module and the bottom layer of the PCB board is a ground plane.
2. The modular transmitter must have buffered modulation data inputs.
The schematic for this unit shows buffered inputs. See the schematic in exhibit 4.
3. The modular transmitter must have its own power supply regulation.
The unit is supplied power by a plug in the wall transformer (wall wart). The unit has an on board 5 volt and 8 volt regulators.
4. The modular transmitter must comply with the antenna requirements of Section 15.203 and 15.204(c).
The unit has a permanently attached $\frac{1}{4}$ wave wire antenna.
5. The modular transmitter must be tested in a stand-alone configuration.
The unit was tested stand alone. See the test setup photograph in exhibit 9.
6. The modular transmitter must be labeled with its own FCC ID number.
See the FCC ID Label Sample and Label Location in exhibits 1 and 2.
7. The modular transmitter must comply with any specific rule or operating requirements applicable to the transmitter.
See the Users Manual in exhibit 5.
8. The modular transmitter must comply with any applicable RF exposure requirements.

The unit is of such low power it meets all RF Exposure requirements.
