To whom it may concern,

The Williams AV FM T55C is an FM transmitter, operating on 17 selectable channels in the 72.1 to 75.9 MHz band. We are seeking original certification for this product under FCC part 15.237 in the United States. Our FCC ID number for this equipment is CNMFMT55C.

This product will be marketed under two model numbers, FM T55C and FM T55CD.

The FM T55C base product contains an analog audio input selectable between line or microphone input options. The product processes the audio using DSP techniques. The processed audio is broadcast over the selected broadband frequency. An Ethernet output provides access to a hosted website for system control and monitoring, and streams a digital audio output for transmission using the local area Wi-Fi network. This allows users to listen to the broadcast using either an FM receiver, or an Android or Apple phone app.

The FM T55CD operates identically to the base model, and contains an additional audio input module that plugs into the motherboard internally. This provides selectable a Dante digital audio input signal option.

We are seeking acceptance of our compliance in order to market our equipment in the United States. Additional documentation will be provided to demonstrate appropriate compliance to the aforementioned regulations.

Sincerely,

A handwritten signature in black ink, appearing to read "Per Danzl", written over a horizontal line.
