1.5 Test Methodology

All measurements contained in this report were conducted in accordance with TIA-603-D

1.6 Measurement Uncertainty

All measurements involve certain levels of uncertainties, especially in the field of EMC. The factors contributing to uncertainties are spectrum analyzer, cable loss, antenna factor calibration, antenna directivity, antenna factor variation with height, antenna phase center variation, antenna factor frequency interpolation, measurement distance variation, site imperfections, mismatch (average), and system repeatability.

Based on CISPR16-4-2:2011, The Treatment of Uncertainty in EMC Measurements, the values ranging from ± 2.0 dB for Conducted Emissions tests and ± 4.0 dB for Radiated Emissions tests are the most accurate estimates pertaining to uncertainty of EMC measurements at BACL Corp.

7 FCC §2.1046, §90.205(s) & §90.103(c) - RF Output Power

7.1 Applicable Standard

FCC §2.1046

FCC §90.205 (s) The output power shall not exceed by more than 20 percent either the output power shown in the Radio Equipment List [available in accordance with §90.203(a)(1)] for transmitters included in this list or when not so listed, the manufacturer's rated output power for the particular transmitter specifically listed on the authorization.

FCC §90.103 (c) (13) Operations in this band are limited to survey operations using transmitters with a peak power not to exceed 5 watts into the antenna.

7.2 Measurement Procedure

The transmitter output was connected to the input terminal via calibrated coaxial cable. The output power was measured with the wideband power meter at the low, middle and high channel in each band.

KDB 9771168 wideband power measurement method is used.
