2.3. Test Procedures

Radiated emissions from the EUT were measured according to the dictates of ANSI C63.10-2013.

2.3.1. Test Procedures for emission below 30 Mb

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. Then antenna is a loop antenna is fixed at one meter above the ground to determine the maximum value of the field strength. Both parallel and perpendicular of the antenna are set to make the measurement.
- c. For each suspected emission, the EUT was arranged to its worst case and then the table was turned from 0 degrees to 360 degrees to find the maximum reading.
- d. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

2.3.2. Test Procedures for emission from 30 Mb to 1 000 Mb

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. During performing radiated emission below 1 % the EUT was set 3 meters away from the interference receiving antenna, which was mounted on the top of a variable-height antenna tower. During performing radiated emission above 1 % the EUT was set 3 meter away from the interference-receiving antenna.
- c. The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the table was turned from 0 degrees to 360 degrees to find the maximum reading.

2.3.3. Test Procedures for emission above 1 @

- a. The EUT was placed on the top of a rotating table 1.5 meters above the ground at a 3 meter anechoic chamber test site. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The resolution bandwidth and video bandwidth of test receiver/spectrum analyzer is 1 \(\mathbb{M}\) for Peak detection at frequency above 1 \(\mathbb{M}\).

4.2. Limit

According to A.1.3 of RSS-210 Issue 10, the occupied bandwidth of momentarily operated devices shall be less than or equal to 0.25 % of the centre frequency for devices operating between 70 $\,\text{Mz}$ and 900 $\,\text{Mz}$. For devices operating above 900 $\,\text{Mz}$, the occupied bandwidth shall be less than or equal to 0.5 % of the centre frequency.

4.3. Test Procedure

- 1. The transmitter output is connected to the spectrum analyzer.
- 2. The resolution bandwidth (RBW) shall be in the range of 1 % to 5 % of the occupied bandwidth (OBW) and video bandwidth (VBW) shall be approximately 3 x RBW.
- 3. The bandwidth of fundamental frequency was measured and recorded.

5. Transmission Time

5.1. Test Setup

5.2. Limit

5.2.1. FCC

According to §15.231(a)(1), a manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.

5.2.2. IC

According to A.1.1(a) of RSS-210 Issue 10, a manually operated transmitter shall be equipped with a push-to-operate switch and be under manual control at all times during transmission. When released, the transmitter shall cease transmission within no more than 5 seconds of being released.

5.3. Test Procedure

- 1. The transmitter output is connected to the spectrum analyzer.
- 2. The bandwidth of the fundamental frequency was measured with the spectrum analyzer using RBW = 1 Mb, VBW = 1 Mb, Span = 0 Hz, Sweep Time = 10 sec.
- 3. The bandwidth of fundamental frequency was measured and recorded.

6.4. Test Result

Ambient temperature : (23 ± 1) °C Relative humidity : 47 % R.H.

CALCULATION:

Average Reading = Peak Reading ($dB\mu N/m$) + 20log (Duty Cycle).

In order to determine possible Maximum Modulation percentage, alternations are made to the EUT. We measured;

T _{on+off}	Ton	M % = (T _{on} / T _{on+off}) * 100 %	Duty Correction Factor	
100 ms	100 ms	1	0 dB	

 $T_{on+off} = 100 \text{ ms.}$

 $T_{on} = 100 \text{ ms.}$

Duty Cycle = $20\log (T_{on} / T_{on+off}) = 20\log (1) = 0$ dB.

Remark;

- T_{on} = 100.0 ms (on time is 100 ms instead of 395 ms).
- T_{on+off} = 100 ms (pulse train is 100 ms instead of 2.985 sec).

7. Antenna Requirement

7.1. Standard Applicable

For intentional device, according to FCC 47 CFR Section §15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

7.2. Antenna Connected Construction

Antenna used in this product is PCB Pattern Antenna with gain of -22.31 dB i.
