

## EMI TEST REPORT

JQA APPLICATION NO. : 400-20436

Model No. : Socket Bluetooth Card

Type of Equipment : Socket Bluetooth CF Card

Regulations Applied : CFR 47 FCC Rules and Regulations Part 15

FCC ID : CWTBTC-1

Applicant : Alps Electric Co., Ltd.

Address : 1-2-1, Okinouchi, Soma-city,,  
Fukushima pref. 976-8501, Japan

Manufacturer : Alps Electric Co., Ltd.

Address : 1-2-1, Okinouchi, Soma-city,,  
Fukushima pref. 976-8501, Japan

Received date of EUT : September 17, 2002

**Final Judgment : Passed**

Test results in this report are obtained in use of equipment that is traceable to National Institute of Advanced Industrial Science and Technology (AIST) of Japan and Communication Research Laboratory (CRL) of Japan.

The test results only respond to the tested sample. This report should not be reproduced except in full, without the written approval of JQA EMC Engineering Dept. Testing Div.

**1 DOCUMENTATION****1.1 TEST REGULATION**

FCC Rules and Regulations Part 15 Subpart B and Subpart C

**Test procedure:**

The tests were performed with reference to the FCC Public Notice DA 00-705, released March 30, 2000. The test set-up was made in accordance to the general provisions of ANSIC63.4-1992.

**1.2 GENERAL INFORMATION****1.2.1 Test facility:**

- 1) Test Facility located at EMC Engineering Dept. Testing Div.:
  - No.2 and 3 Anechoic Chambers (3 meters Site).
  - Shielded Enclosure.Expiration date of FCC test facility filing: May 27, 2005

- 2) EMC Engineering Dept. Testing Div. is recognized under the National Voluntary Laboratory accreditation Program for satisfactory compliance established in title 15, Part 285 Code of Federal Regulations.  
NVLAP Lab Code: 200189-0 (Effective through : June 30, 2003)

**1.6 SUMMARY****General Remarks:**

The EUT was tested according to the requirements of FCC Rules and Regulations Part 15 Subpart B and Subpart C under the test configuration, as shown in clause 1.7 to 1.10.

The conclusion for the test items which are required by the applied regulation is indicated under the final judgment.

**Final Judgment:**

The "as received" sample;

- x   - fulfill the test requirements of the regulation mentioned on clause 1.1.
- fulfill the test requirements of the regulation mentioned on clause 1.1, but with certain qualifications.
- doesn't fulfill the test regulation mentioned on clause 1.1.

Begin of testing: September 17, 2002

End of testing: September 18, 2002

### 1.7.2 Operating condition

Power supply Voltage: 3.3 VDC or 5.0VDC from the PC card slot on the host PC or DC power supply.

The tests have been carried out the following mode.

- 1-1) TX mode (2402 MHz, Max power setting: DC 3.3V/ 5.0V operation)
- 1-2) TX mode (2402 MHz, Min power setting: DC 3.3V/ 5.0V operation)
- 2-1) TX mode (2441 MHz, Max power setting: DC 3.3V/ 5.0V operation)
- 2-2) TX mode (2441 MHz, Min power setting: DC 3.3V/ 5.0V operation)
- 3-1) TX mode (2480 MHz, Max power setting: DC 3.3V/ 5.0V operation)
- 3-2) TX mode (2480 MHz, Min power setting: DC 3.3V/ 5.0V operation)
- 4) Inquiry mode
- 5) Paging mode
- 6-1) Hopping mode (Max power setting: DC 3.3V/ 5.0V operation)
- 6-2) Hopping mode (Min power setting: DC 3.3V/ 5.0V operation)
- 7) RX mode (including all RX mode)
- 8-1) RX mode (2402 MHz, DC 3.3V/ 5.0V operation)
- 8-2) RX mode (2441 MHz, DC 3.3V/ 5.0V operation)
- 8-3) RX mode (2480 MHz, DC 3.3V/ 5.0V operation)

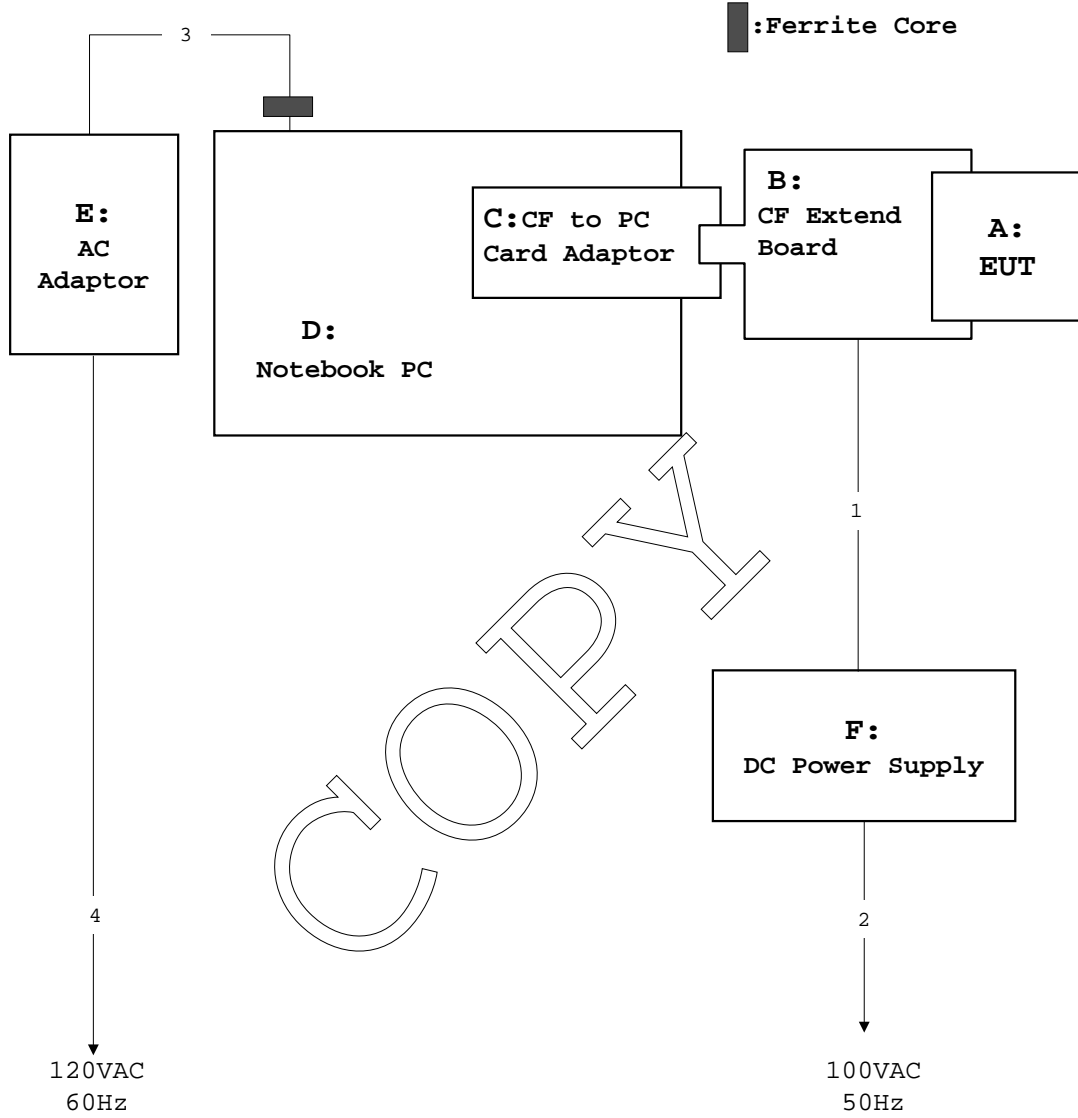

### 1.7.3 Generating and Operating frequency of EUT

TX Function: 16 MHz, 1239.25MHz and 2402 MHz to 2480 MHz

RX Function: 0.5 MHz, 16 MHz, 2439.25MHz and 2402 MHz to 2480 MHz

1.8 EUT ARRANGEMENT (DRAWINGS)

## 1.9 PRELIMINARY TEST AND TEST-SETUP (DRAWINGS)

### 1.9.1 Channel Separation

The EUT have its hopping function enabled.

Use the following spectrum analyzer settings:

Span = wide enough to capture the peaks of two adjacent channels

Resolution (or IF) Bandwidth (RBW)  $\geq$  1% of the span

Video (or Average) Bandwidth (VBW)  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Use the marker-delta function to determine the separation between the peaks of the adjacent channels.

### 1.9.2 Minimum Hopping Channel

The EUT have its hopping function enabled.

Use the following spectrum analyzer settings:

Span = the frequency band of operation

RBW  $\geq$  1% of the span

VBW  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. It may prove necessary to break the span up to sections, in order to clearly show all of the hopping frequencies.

Measurement setup is same as sub-clause 1.9.1.

### 1.9.3 Occupied Bandwidth

Use the following spectrum analyzer settings:

Span = approximately 2 to 3 times the 6 dB or 20 dB bandwidth, centered on a channel

RBW  $\geq$  1% of the 6 dB or 20 dB bandwidth

VBW  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

The EUT should be transmitting at its maximum data rate. Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. Use the marker-delta function to measure 6 dB or 20 dB down one side of the emission. Reset the marker-delta function, and move the marker to the other side of the emission, until it is (as close as possible to) even with the reference marker level. The marker-delta reading at this point is the 6 dB or 20 dB bandwidth of the emission. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.), repeat this test for each variation.

Measurement setup is same as sub-clause 1.9.1.

### 1.9.4 Dwell Time

The EUT must have its hopping function enabled.

Use the following spectrum analyzer settings:

Span = zero span, centered on a hopping channel

RBW  $\leq$  Channel Separation

VBW  $\geq$  RBW

Sweep = as necessary to capture the entire dwell time per hopping channel

Detector function = peak

Trace = max hold

If possible, use the marker-delta function to determine the dwell time. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.), repeat this test for each variation.

Measurement setup is same as sub-clause 1.9.1.

### 1.9.5 Peak Output Power (Conduction)

(Step 1) Use the following spectrum analyzer settings:

Span = approximately 5 times the 20 dB bandwidth, centered on a channel

RBW > the 20 dB bandwidth of the emission being measured

VBW ≥ RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. Record the reading P1.

(Step 2) Replace the EUT with the signal generator. Adjust the level of the signal generator output until the reading P1.

(Step 3) Replace the spectrum analyzer with the power meter. Record the reading of power meter P2. The peak output power of the EUT is P2.

Step 1

Step 2

Step 3

**1.9.6 Peak Power Density (Conduction)**

Use the following spectrum analyzer settings:

Span = approximately 5 times the 20 dB bandwidth, centered on a channel

RBW = Specified Value

VBW ≥ RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission.

Measurement setup is same as sub-clause 1.9.1.

**1.9.7 Peak Output Power and Peak Power Density (Radiation)**

The radiated power output and the field strength of the transmitter radiation were measured at the distance at 3 meters away from the transmitter under test which was placed on a turntable 0.8 meter in height. The receiving antenna was oriented for vertical polarization and raised or lowered through 1 to 4 meters until the maximum signal level was detected on the measuring instrument. The transmitter under test was rotated through 360° until the maximum signal was received. The measurement was repeated with the receiving antenna in the horizontal polarization.

The transmitter was removed and replaced with the antenna. The center of the antenna was placed approximately at the same location as the center of the transmitter. The antenna was fed with a signal generator, and the output level of the signal generator was adjusted to obtain the previously recorded maximum reading at the particular frequency and recorded. This procedure was repeated with the receiving antenna and the antenna in the orthogonal polarization.

The input power into the antenna was measured using the power meter. The level of the emissions in dBm(EIRP) were calculated from the following formula:

$$\text{Transmitter Power[dBm]}(\text{EIRP}) = (\text{Meter Reading of Power Meter}) + (\text{Antenna Gain[dBi]})$$

Use the following spectrum analyzer settings:

Span = approximately 5 times the 20 dB bandwidth, centered on a channel

RBW : Greater then the 20 dB bandwidth of the emission being measured  
or Specified Value

VBW ≥ RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission.

### 1.9.8 Spurious Emission (Conduction)

#### Band-edge Compliance of RF Conducted Emissions

Use the following spectrum analyzer settings:

Span = wide enough to capture the peak level of the emission operating on the channel closest to the band-edge, as well as any modulation products which fall outside of the authorized band of operation

RBW  $\geq$  1% of the span

VBW  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Set the marker on the emission at the bandedge, or on the highest modulation product outside of the band, if this level is greater than that at the bandedge. Enable the marker-delta function, then use the marker-to-peak function to move the marker to the peak of the in-band emission.

Now, using the same instrument settings, enable the hopping function of the EUT. Allow the trace to stabilize. Follow the same procedure listed above to determine if any spurious emissions caused by the hopping function also comply with the specified limit.

#### Spurious RF Conducted Emissions

Use the following spectrum analyzer settings:

Span = wide enough to capture the peak level of the in-band emission and all spurious emissions (e.g., harmonics) from the lowest frequency generated in the EUT up through the 10th harmonic. Typically, several plots are required to cover this entire span.

RBW = 100 kHz

VBW  $\geq$  RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Set the marker on the peak of any spurious emission recorded. The level displayed must comply with the limit specified in this Section.

Measurement setup is same as sub-clause 1.9.1.

**1.9.9 Radiated Emission (9 kHz - 30 MHz):**

According to description of ANSI C63.4-1992 sec.13.1.4.1, the preliminary radiated emissions measurement was carried out. The preliminary radiated measurements were performed at the measurement distance that specified for compliance to determine the emission characteristics of the EUT.

The EUT configuration, cable configuration and mode of operation were determined for producing the maximum level of emissions. These configurations were used for the final radiated emissions measurements.

- Side View -

**1.9.10 Radiated Emission (30 MHz - 1000 MHz):**

According to description of ANSI C63.4-1992 sec.13.1.4.1, the preliminary radiated emissions measurement was carried out. The preliminary radiated measurements were performed at the measurement distance that specified for compliance to determine the emission characteristics of the EUT.

The EUT configuration, cable configuration and mode of operation were determined for producing the maximum level of emissions. These configurations were used for the final radiated emissions measurements.

### 1.9.12 AC Power Line Conducted Emission (150 kHz - 30 MHz) :

According to description of ANSI C63.4-1992 sec.13.1.3.1, the AC power line preliminary conducted emissions measurements were carried out.

The preliminary conducted measurements were performed using the spectrum analyzer to observe the emission characteristics of the EUT.

The EUT configuration, cable configuration and mode of operation were determined for producing the maximum level of emissions. These configurations were used for final AC power line conducted emissions measurements.

## 2.4 Dwell Time

Date : September 17, 2002

Temp. : 23 °C Humi. : 70 %

Mode of EUT : Hopping(DH1 packet, Max power setting: DC 3.3V/ 5.0V operation)  
 Test Port : Temporary antenna connector

Dwell Time (ms)	Limit
141.09	400 ms per 31.6 s

Note : The system makes worst case 1600 hops per second or 1 time slot has a length of 625µs with 79 channels. A DH1 Packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 800 hops per second with 79 channels. So the system has each channel 10.1266 times per second and so for 31.6 seconds the system have 320 times of appearance. Each tx-time per appearance is 0.4409 ms.  
 Dwell time = 320 \* 0.4409 = 141.09 ms

Mode of EUT : Hopping(DH3 packet, Max power setting: DC 3.3V/ 5.0V operation)  
 Test Port : Temporary antenna connector

Dwell Time (ms)	Limit
274.14	400 ms per 31.6 s

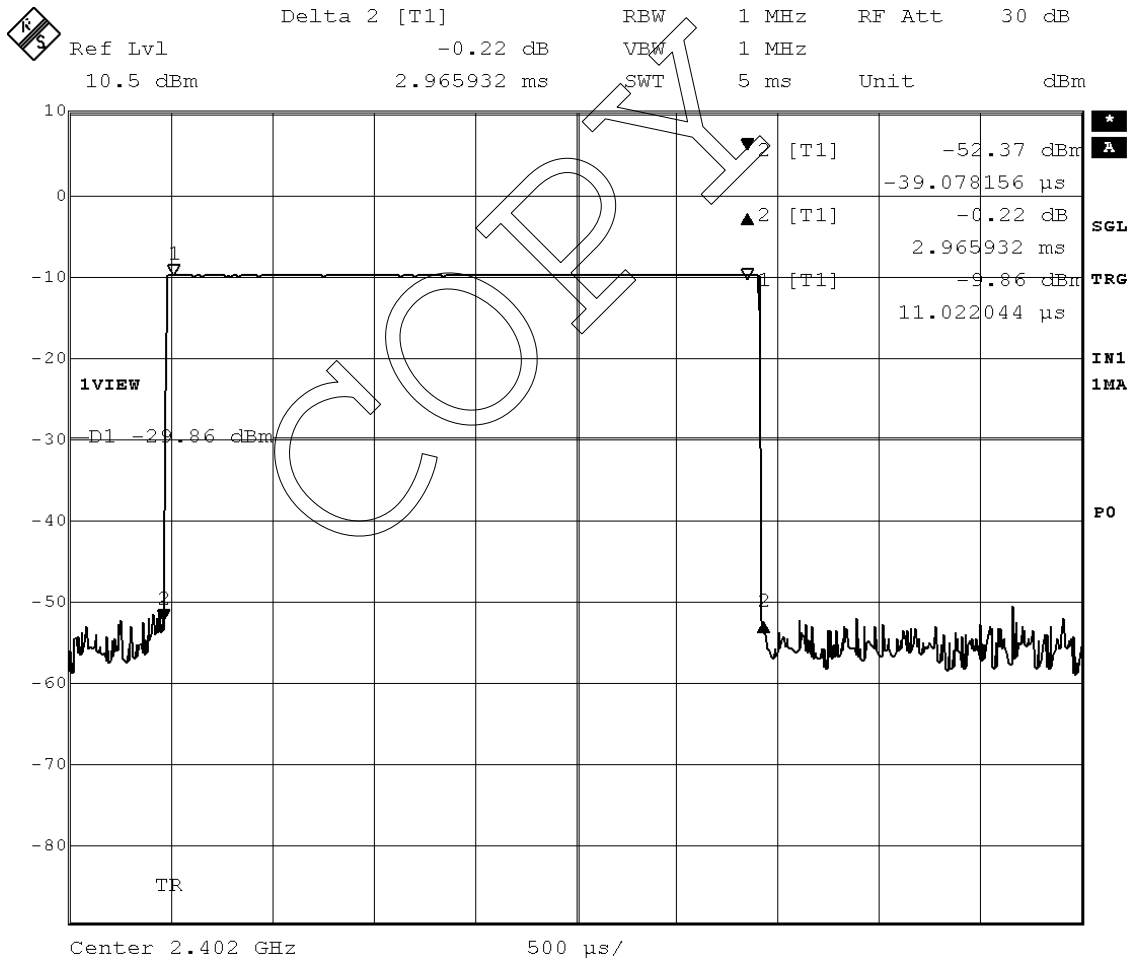

Note : A DH3 Packet need 3 time slot for transmitting and 1 time slot for receiving.  
 Then the system makes worst case 400 hops per second with 79 channels. So the system have each channel 5.063 times per second and so for 31.6 seconds the system have 160 times of appearance.  
 Each tx-time per appearance is 1.7134 ms.  
 Dwell time = 160 \* 1.7134 = 274.14 ms

Mode of EUT : Hopping(DH5 packet, Max power setting: DC 3.3V/ 5.0V operation)  
 Test Port : Temporary antenna connector

Dwell Time	Limit
(ms)	
316.36	400 ms per 31.6 s

Note : A DH5 Packet need 5 time slot for transmitting and 1 time slot for receiving.  
 Then the system makes worst case 266.667 hops per second with 79 channels.  
 So the system have each channel 3.3755 times per second and so for 31.6 seconds  
 the system have 106.667 times of appearance.  
 Each tx-time per appearance is 2.9659 ms.  
 Dwell time = 106.667 \* 2.9659 = 316.36 ms

Mode of EUT : Inquiry/Paging  
 Test Port : Temporary antenna connector

Dwell Time	Limit
(ms)	
106.32	400 ms per 12.8 s

Note : The system have 32 hopping channel in Inquiry/Paging mode.  
 The time period = 32 \* 0.4 = 12.8 seconds  
 Dwell time = 0.1387 \* 2555.1/10 \* 3 = 106.32 ms

- Notes :
- 1) The spectrum was checked from 1.0 GHz to 12.4 GHz.
  - 2) The cable loss, amp. gain and antenna factor are included in the correction factor.
  - 3) The symbol of "<" means "or less".
  - 4) The symbol of ">" means "or greater".
  - 5) A sample calculation(Peak) was made at 1.2003 (GHz).  
 $PA + Cf + Mr = 0 + -4.8 + 47.9 = 43.1$  (dBuV/m)  
 PA = Peak to Average Factor(P-A Factor)  
 Cf = Correction Factor  
 Mr = Meter Reading

6) Measuring Instrument Setting :
