

## Declaration to ESN

### Protection against unauthorized ESN and firmware upgrade

The electric serial number (ESN) bits in this module encoded and spread over various non-sequential memory locations in order to prevent detection and modification.

Once the factory has programmed the ESN, the mobile firmware can not overwrite or alter the ESN memory locations.

Both the ESN host and operation systems components are permanently mounted to the module in order to prevent removal and misuse. Unauthorized attempts to alter the module's firmware will cause the unit to inoperable.
