## SECTION 2: Equipment under test (E.U.T.)

#### 2.1 Identification of E.U.T.

| Type of Equipment          | : | Passive Entry System (Hand Unit)                                  |
|----------------------------|---|---|
| Model No.                  | : | TWB1U789  |
| Serial No.                 | : | Refer to Clause 4.2   |
| Rating                     | : | DC3.0V (CR2025)   |
| Receipt Date of Sample     | : | January 21, 2010  |
| Country of Mass-production | : | Japan   |
| Condition of EUT           | : | Production prototype  |
|                            |   | (Not for Sale: This sample is equivalent to mass-produced items.) |
| Modification of EUT        | : | No modification by the test lab                                   |
| Niouniou of Ec I           | • | The moundation by the test has                                    |

#### 2.2 Product Description

Passive Entry System (Hand Unit), model: TWB1U789 is carried by the owner of the vehicle. It performs transmission through RF antenna to tuner (I-KEY unit), processes LF signal from I-KEY unit, and performs actions according to the signal.

| <b>General Specification</b>       |   |                           |
|------------------------------------|---|---------------------------|
| Radio Type                         | : | Transceiver               |
| Clock frequency(ies) in the system | : | 2MHz (CPU Clock)          |
| Radio Specification                |   |                           |
| [Transmitter]                      |   |                           |
| Frequency of Operation             | : | 314.975MHz                |
| Modulation                         | : | FSK                       |
| Method of Frequency Generation     | : | SAW Resonator             |
| Antenna type                       | : | PCB Pattern antenna       |
| [Receiver]                         |   |                           |
| Frequency of Operation             | : | 125kHz                    |
| Antenna type                       | : | Loop Coil and Bar Antenna |

#### **SECTION 3: Test specification, procedures & results**

#### 3.1 Test Specification

| Test Specification | : FCC Part 15 Subpart C: 2009, final revised on December 2, 2009          |
|--------------------|---|
| Title              | : FCC 47CFR Part15 Radio Frequency Device Subpart C Intentional Radiators |
|                    | Section 15.231 Periodic operation in the band 40.66 - 40.70MHz            |
|                    | and above 70MHz   |

#### FCC 15.31 (e)

This test was performed with the New Battery (DC 3.0V) and the constant voltage was supplied to the EUT during the tests. Therefore, the EUT complies with the requirement.

#### FCC Part 15.203 Antenna requirement

It is impossible for end users to replace the antenna, because the antenna is mounted inside of the EUT. Therefore, the equipment complies with the antenna requirement of Section 15.203.

#### 3.3 Addition to standard

| Item         | Test Procedure    | Specification     | Worst margin | Results  | Remarks  |
|--------------|-------------------|-------------------|--------------|----------|----------|
| 99% Occupied | IC: RSS-Gen 4.6.1 | IC: RSS-Gen 4.6.1 | N/A          | Complied | Radiated |
| Bandwidth    |                   |                   |              |          | l        |

Other than above, no addition, exclusion nor deviation has been made from the standard.

#### 3.4 Uncertainty

#### EMI

The following uncertainties have been calculated to provide a confidence level of 95% using a coverage factor k=2.

| Test room<br>(semi-<br>anechoic | Radiated emission<br>(10m*)( <u>+</u> dB) |         |        |                     | Radiate | ed emission | l                   |          |         |
|---------------------------------|---|---------|--------|---------------------|---------|-------------|---------------------|----------|---------|

# <u>SECTION 5:</u> Radiated emission (Electric Field Strength of Fundamental and Spurious Emission)

#### **Test Procedure and conditions**

EUT was placed on a urethane platform of nominal size, 0.5m by 1.0m, raised 0.8m above the conducting ground plane. The EUT was set on the center of the tabletop.

Test was made with the antenna positioned in both the horizontal and vertical planes of polarization. The measurement antenna was varied in height above the conducting ground plane to obtain the maximum signal strength. Photographs of the set up are shown in Appendix 1.

#### [Transmitting mode]

The Radiated Electric Field Strength has been measured on Semi anechoic chamber with a ground plane and at a distance of 3m.

The measuring antenna height was varied between 1 and 4m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field strength.

The measurements were performed for both vertical and horizontal antenna polarization.

The radiated emission measurements were made with the following detector function of the test receiver/spectrum analyzer.

#### Test Antennas are used as below;

| r est rintennas are asea as belowy |              |             |                 |                |            |
|------------------------------------|--------------|-------------|-----------------|----------------|------------|
|                                    | Frequency    | Below 30MHz | 30MHz to 300MHz | 300MHz to 1GHz | Above 1GHz |
|                                    | Antenna Type | Loop        | Biconical       | Logperiodic    | Horn       |

|               | Below or equal to<br>1GHz            | Above 1GHz                        |
|---------------|--------------------------------------|-----------------------------------|
| Detector Type | Peak and<br>Peak with Duty<br>factor | Peak and<br>Peak with Duty factor |
| IF Bandwidth  | 120kHz                               | PK: S/A:RBW 1MHz,<br>VBW:1MHz     |

- The carrier level (or, noise levels) was (or were) measured at each position of all three axes X, Y and Z, and the position that has the maximum noise was determined.

With the position, the noise levels of all the frequencies was measured.

This EUT has two modes which mechanical key is inserted or not. The worst case was confirmed with and without mechanical key, as a result, the test without mechanical key was the worst case. Therefore the test without mechanical key was performed only.

\*The result is rounded off to the second decimal place, so some differences might be observed.

| Measurement range | : 30MHz-3.2GHz |
|-------------------|----------------|
| Test data         | : APPENDIX     |
| Test result       | : Pass         |

#### [Receiving mode]

The Radiated Electric Field Strength has been measured on a semi anechoic chamber with a ground plane and at a distance of 3m.

Frequency : From 9kHz to 30MHz at distance 3m

The EUT was rotated a full revolution in order to obtain the maximum value of the electric field strength. The measurements were performed for vertical polarization (antenna angle: 0deg., 45deg., 90deg., and 135 deg.) and horizontal polarization.

\*Refer to Figure 1 about Direction of the Loop Antenna.

Frequency : From 30MHz to 1000MHz at distance 3m

The measuring antenna height was varied between 1 and 4m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field strength.

The measurements were performed for both vertical and horizontal antenna polarization.

The radiated emission measurements were made with the following detector function of the test receiver/spectrum analyzer.

|               | From 9kHz to 90kHz<br>and<br>From 110kHz to<br>150kHz | From<br>90kHz to<br>110kHz | From<br>150kHz<br>to 490kHz | From<br>490kHz to<br>30MHz | From<br>30MHz to<br>1GHz |
|---------------|---|----------------------------|-----------------------------|----------------------------|--------------------------|
| Detector Type | PK/AV   | QP                         | PK/AV                       | QP                         | QP                       |
| IF Bandwidth  | 200Hz   | 200Hz                      | 9kHz                        | 9kHz                       | 120kHz                   |

The worst case in receiving mode was confirmed with and without mechanical key, as a result, no difference was seen. Therefore the test with mechanical key was performed only.

\* Part 15 Section 15.31 (f)(2) (9kHz-30MHz) [Limit at 3m]=[Limit at 300m]-40 x log (3[m]/300[m]) [Limit at 3m]=[Limit at 30m]-40 x log (3[m]/30[m])

\*The result is rounded off to the one decimal place, so some differences might be observed.

| Measurement range | : 9kHz-1000MHz |

## **SECTION 6: Automatically deactivate**

#### **Test Procedure**

The measurement was performed with Electric field strength using a spectrum analyzer.

| Test data   | : APPENDIX |
|-------------|------------|
| Test result | : Pass     |

## SECTION 7: -20dB and 99% Occupied Bandwidth

#### **Test Procedure**

The measurement was performed in the antenna height to gain the maximum of Electric field strength.

| Test data   | : APPENDIX |
|-------------|------------|
| Test result | : Pass     |
