Engineering Test Report No. SEL-030/QLXD2 J50A Part74H

SHURE

ELECTROMAGNETIC COMPATIBILITY LABORATORY **TEST REPORT**

TEST REPORT TITLE: Electromagnetic Compatibility Tests of the Shure QLXD2 J50A Digital Wireless Transmitter in the 572MHz to 607MHz Band

TEST ITEM DESCRIPTION:

The Shure QLXD2 is a digital wireless microphone transmitter, microprocessor controlled transmitter.

| For: | Shure Incorporated 5800 West Touhy Avenue Niles, IL 60714 |

1. INTRODUCTION

1.1. Scope of Tests

This report presents the results of testing per FCC Part 74, Subpart H, 74.861, Radiated RF Spurious Emissions, Power Output, and Necessary Bandwidth. The following data was taken following the measurement method as described in the document section(s) listed on page 1 of this document. Provided is the data for the test sample. Also included is a summary of the measurements made and a description of the measurement setup. The test sample meet the requirements of the above standards. The equipment under test (EUT) contained a transmitter that was designed to transmit in the UHF TV frequency bands shown in Table 1.

| Model | Band | Frequency (MHz) | Output Power (mW) |
|-------|------|-----------------|-------------------|
| QLXD2 | J50A | 572 - 607 | 1 and 10 |
| | | | - |

Table 1. EUT Frequency Band and Power Levels

1.2. Purpose

This series of testing was performed to determine if the test item would meet the requirements of FCC Part 74, Subpart H, 74.861, radiated spurious emissions 74.861 subsection 6 iii, power output 4 e iii, and occupied bandwidth 74.861 subsection 7.

1.3. Deviations, Additions and Exclusions

None

1.4. EMC Laboratory Identification

The electromagnetic compatibility tests were performed at the Shure Electromagnetic Laboratory, Shure Incorporated, 5800 West Touhy Ave, Niles, Illinois 60714-4608. This laboratory is registered with Industry Canada as Site # 616A-1. The Shure Electromagnetic Laboratory is accredited by the National Institute of Standards and Technology (NIST) under the National Voluntary Laboratory Accreditation Program (NVLAP). The NVLAP Lab Code is: 200946-0.

1.5. Summary of Tests Performed

The following electromagnetic compatibility tests (Table 2) were performed on the test item in accordance with ETSI specifications.

| Test Spec | Description | Tested Frequency | Appendix | Test Results |
|--------------|--|------------------|----------|--------------|
| FCC Part 74H | Radiated Spurious Emissions | 30 MHz to 10 GHz | А | Pass |
| FCC Part 74H | Power Output | 589.500MHz | В | Pass |
| FCC Part 74H | Necessary Bandwidth Measurements | 589.500MHz | С | Pass |

Table 2. Summary of tests performed

2. APPLICABLE DOCUMENTS

The following documents of the exact issue designated form part of this document to the extent specified herein:

FCC Part 74 Part H, "Low Power Auxiliary Stations", 74.861

EN 300 422-1 v1.4.2 (2011-08), "Wireless Microphone "Electromagnetic Compatibility and Radio spectrum Matters (ERM); Wireless microphones in the 25MHz to 3GHz frequency range; Part 1; Technical characteristics and methods of measurements"

ANSI C63.4 (2014), "American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz"

3. EUT SET-UP AND OPERATION

3.1. General Description

The test sample used was Shure QLXD2 digital wireless microphone transmitter. The EUT was arranged and tested per individual Appendices.

3.2 Test Sample

The following product sample was tested:

Table 3: Shure QLXD2 J50A Digital Wireless Transmitter Sample

QLXD2 J50A Serial Numbers

#1

3.3 Operational Mode

All radiated spurious emissions, power output, and necessary bandwidth tests were performed separately in the transmit frequency and output power modes shown in Table 4.

| Band | Frequency in MHz | Power Level in mW |
|------|------------------|-------------------|
| J50A | 589.500 | 10 |

Table 4. EUT Frequencies and Power Levels

4. Test Instrumentation

A list of the test equipment used can be found in Table 10-1. All equipment used was within calibration during and throughout the duration of the tests. All calibrations are traceable to the National Institute of Standards and Technology (NIST).

5. Procedure

The specific test procedures are presented in the individual appendices.

6. Other Test Conditions:

6.1. Test Personnel

All EMC tests were performed by qualified personnel from the Shure EMC Laboratory.

6.2. Disposition of the EUT

The EUTs and all associated equipment were returned to Shure Incorporated upon completion of the tests.

7. Results of Tests:

The results are presented in Appendices. It was found that the EUT meet the requirements of FCC Part 74 Subpart H, 74.861 for Radiated RF Spurious Emissions, Power Output, and Necessary Bandwidth.

8. Conclusions:

It was determined that the Shure QLXD2 J50A Digital Wireless Microphone Transmitter did fully comply with the requirements of FCC Part 74 Subpart H, 74.861, Radiated RF Spurious Emissions, Power Output, and Necessary Bandwidth.

9. **Certification**:

Shure EMC Laboratory certifies that the information contained in this report was obtained under conditions which meet or exceed those specified in the test specifications.

The data presented in this test report pertains to the EUTs at the test date. Any electrical or mechanical modification made to the EUTs subsequent to the specified test date will serve to invalidate the data and void this certification.

This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Table 10-1 Test Equipment

A. RADIATED RF SPURIOUS EMISSIONS – 30 MHZ TO 10 GHZ

Purpose:

This test performed to determine if the EUT meets the radiated RF emission requirements of the FCC Part 74 Subpart H over the frequency range from 30MHz to 10GHz. An Average detector was used for the measurements.

Requirements:

As stated in FCC Part 74, Subpart H, 74.861, radiated spurious emissions 74.861 subsection 6 iii, spurious emissions must meet the limits specified in section 8.4 of ETSI EN 300 422-1 V1.4.2 (2011-08)

Measurement Uncertainty:

All measurements are an estimate of their true value. The measurement uncertainty characterizes, with a specified confidence level, the spread of values which may be possible for a given measurement system.

Values of Expanded Measurement Uncertainty (95% Confidence)

| Measurement Type | U _{lab} | U _{etsi} |
|---|------------------|-------------------|
| Radiated disturbance (electric field strength on an open area test site or alternative test site) (30 MHz – 1000 MHz) | 4.12 dB | 6.00 dB |
| Radiated disturbance (electric field strength on an open area test site or alternative test site) (1 GHz – 13 GHz) | 4.56 dB | 6.00 dB |

 $U_{\text{lab}\,\text{=}}$ Determined for Shure EMC Laboratory

U_{ETSI =} From ETSI EN 300 422-1 Table 6

Since U_{lab} is less than or equal to U_{ETSI} :

- Compliance is deemed to occur if no measured disturbance exceeds the disturbance limit;

Non-compliance is deemed to occur if any measured disturbance exceeds the disturbance limit.

Test Setup and Instrumentation:

Photographs of the test setup are shown in Figure 1 and Figure 2. The test instrumentation can be determined from Table 10-1.

EUT Operation:

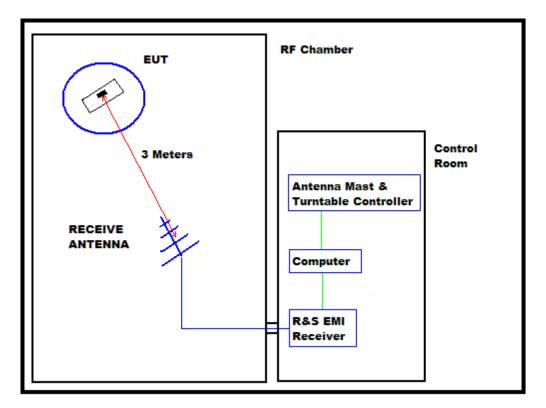

The EUT was powered up and the frequency of the transmitter was selected using the front panel controls. The EUT was checked for proper operation after it was setup on the table. For radiated spurious emission and necessary bandwidth testing, the testing was conducted with the EUT set to the middle frequency within the operating frequency range, and at 10mW RF output.

Specific Test Procedures:

All tests were performed in a 28ft. x 20ft. x 18.5ft. 3m semi-anechoic test chamber. The walls and ceiling of the shielded chamber are lined with ferrite tiles. Anechoic absorber material is installed over the ferrite tile. The floor of the chamber is used as the ground plane. The chamber complies with ANSI C63.4-2003 for site attenuation.

The shielded enclosure prevents emissions from other sources, such as radio and TV stations from interfering with the measurements. All power lines and signal lines entering the enclosure pass through filters on the enclosure wall. The power line filters prevent extraneous signals from entering the enclosure on these leads.

BLOCK DIAGRAM OF SHIELDED ENCLOSURE

Preliminary radiated measurements were performed to determine the frequencies where the significant emissions might be found. With the EUT at one set position and the measurement antenna at a set height (i.e. without maximizing), the radiated emissions were measured using a peak detector and automatically plotted. The BiConiLog measuring antenna was positioned at a 3 meter distance from the EUT.

All significant broadband and narrowband signals found in the preliminary sweeps were then measured using a peak detector at a test distance of 3 meters. The measurements were made with a BiConiLog antenna over the frequency range of 30 MHz to 1 GHz, and a double ridged waveguide antenna over the frequency range of 1 GHz to 10 GHz.

To ensure that maximum emission levels were measured, the following steps were taken:

- i. The EUT was rotated so that all of its sides were exposed to the receiving antenna.
- ii. Since the measuring antennas are linearly polarized, both horizontal and vertical field components were measured.
- iii. The measuring antenna was raised and lowered from 1 to 4 meters for each antenna polarization to maximize the readings.

The equivalent power was determined from the field intensity levels measured at 3 meters using the substitution method. To determine the emission power, another antenna was set in place of the EUT and connected to a calibrated signal generator. (A tuned dipole was used for all measurements below 1GHz and a double ridged waveguide antenna was used for all measurements above 1GHz.) The output of the signal generator was adjusted to match the received level at the EMI receiver. The signal level was recorded. The reading was corrected to compensate for cable loss and antenna gain.

Results:

The plots of the peak preliminary radiated voltage levels and maximized peak radiated voltage levels results are presented on page 12 thru page 17. The ERP measurements are shown on page 18. All emissions measured from the EUT were within the ETSI EN 300 422-1 specification limits.

Total (dBm) = Matched Signal. Generator Reading (dBm) + Antenna Gain (dB) – Cable Loss (dB)

Appendix B

B. Power Output

Purpose:

This test performed to determine if the EUT meets the Power Output requirements of the FCC Part74H, Section 74.861.

Requirements:

As stated in FCC 74H Section 74.861, the maximum radiated power in the 600MHz guard band and the 600MHz duplex gap: 20mW EIRP.

Measurement Uncertainty:

All measurements are an estimate of their true value. The measurement uncertainty characterizes, with a specified confidence level, the spread of values which may be possible for a given measurement system.

Values of Expanded Measurement Uncertainty (95% Confidence)

| Measurement Type | U _{lab} |
|--|------------------|
| Conducted measurements (30 MHz – 1000 MHz) | 1.24 dB |

U_{lab =} Determined for Shure EMC Laboratory

Since U_{lab} is less than or equal to U_{ETSI} :

Compliance is deemed to occur if no measured disturbance exceeds the disturbance limit;
 Non-compliance is deemed to occur if any measured disturbance exceeds the disturbance limit.

Test Setup and Instrumentation:

Photographs of the test setup are shown in Figure 1. The test instrumentation can be determined from Table 10-1.

EUT Operation:

The EUT was powered up and the frequency of the transmitter was selected using the front panel controls. For rated output power, the testing was conducted with the EUT set to the middle frequency within the operating frequency range, and at 10mW RF output.

Appendix B

Specific Test Procedures:

The output of the EUT was connected to a spectrum analyzer through 20dB of attenuation. The EUT was set to transmit on the middle frequency. The channel power was measured.

The spectrum analyzer was set to:

RBW 10kHz VBW 100kHz Channel BW 200kHz Span 1MHz Detector Average State Average

Results:

The EIRP for the middle frequency meets the FCC74H 74.861 requirements.

Measured QLXD2 J50A antenna gain is -0.30dBi

NECESSARY BANDWIDTH MEASUREMENTS

B.1 PURPOSE

This test was performed to determine if the EUT meets the occupied bandwidth requirements of EN 300 422-1, section 8.3.3., with the EUT operating at 589.500MHz and at 10mW RF Output.

B.2 REQUIREMENTS

As stated in EN 300 422-1, section 8.3.3, the emission mask given in section 8.3.3.2 shall not be exceeded.

B.3 TEST SETUP AND INSTRUMENTATION

A photograph of the test setup is shown in Figure B-1. The test instrumentation can be determined from Table 10-1.

B.4 MEASUREMENT UNCERTAINTY

All measurements are an estimate of their true value. The measurement uncertainty characterizes, with a specified confidence level, the spread of values which may be possible for a given measurement system.

Values of Expanded Measurement Uncertainty (95% Confidence):

| Measurement Type | U _{LAB} |
|---------------------|------------------|
| Necessary Bandwidth | ±0.130 % |

 U_{lab} = Determined for Shure EMC Laboratory

Since U_{LAB} is less than or equal to U_{ETSI} :

- Compliance is deemed to occur if no measured disturbance exceeds the disturbance limit;
- Non-compliance is deemed to occur if any measured disturbance exceeds the disturbance limit.

B.5 EUT OPERATION

The EUT was powered up and the transmit frequency and power output of the EUT were selected. The EUT was checked for proper operation after it was setup for the test. Testing was conducted with the EUT set to transmit at 589.500MHz, at an output power level of 10mW. The transmitter was modulated per EN300422-1 V1.4.2 (2011-08), clause 7.1.2.

B.6 TEST PROCEDURE

The test procedure followed is shown in EN300422-1 V1.4.2 (2011-08), section 8.3.3.1.

B.7 RESULTS

The necessary bandwidth data is presented on pages 24 and 26. Data is shown on the figures for each transmitter. The figure shows the maximum relative level within the emission mask with modulation. As shown by the test data, the necessary bandwidth of the EUT meets the requirements of EN 300 422-1, section 8.3.3.
