RE: Shure Incorporate

FCC ID: DD4SLX2

I have a few comments on the above referenced Application.

- 1) Internal photographs tend to suggest that this device was modified to meet compliance (see note on subshield). The schematic provided should contain this modification. Also note that page 25 of the test report states no modifications were made by the test lab. Please explain and/or comment.
- 2) The users manual (H5, J3, L4, P4, R5, S6, JB, Q4) & schematics (H5, J3, L4, R5, S6) mention several different frequency ranges that do not appear to be covered by the application. Note that Part 74 only allows operation up to 806 MHz. Please explain.
- 3) Page 22 of the test report mentions operation from 518 - 865 MHz. Also, see question #2. Please explain.
- 4) For the H5 & L4 versions, the substitution method appears to be performed at 2916 MHz. This frequency does not appear to be in the radiated scan measurements, or related to the measurements made. Please explain.
- 5) The photograph on page 152 of the test report does not appear correct. Please comment.
- 6) Please supply the DC voltages & Currents into the several elements of the final radio frequency amplifying device for normal operation over the power range.

Timothy R. Johnson  
Examining Engineer

The items indicated above must be submitted before processing can continue on the above referenced application. Failure to provide the requested information may result in application termination. Correspondence should be considered part of the permanent submission and may be viewed from the Internet after a Grant of Equipment Authorization is issued.

Please do not respond to this correspondence using the email reply button. In order for your response to be processed expeditiously, you must submit your documents through the AmericanTCB.com website. Also, please note that partial responses increase processing time and should not be submitted.

Any questions about the content of this correspondence should be directed to the sender.
